Formal Languages And Automata Theory Nagpal Notes:

Representation Theory of Finite Monoids Benjamin Steinberg, 2016-12-09 This first text on the subject provides a comprehensive introduction to the representation theory of finite monoids Carefully worked examples and exercises provide the bells and whistles for graduate accessibility bringing a broad range of advanced readers to the forefront of research in the area Highlights of the text include applications to probability theory symbolic dynamics and automata theory Comfort with module theory a familiarity with ordinary group representation theory and the basics of Wedderburn theory are prerequisites for advanced graduate level study Researchers in algebra algebraic combinatorics automata theory and probability theory will find this text enriching with its thorough presentation of applications of the theory to these fields Prior knowledge of semigroup theory is not expected for the diverse readership that may benefit from this exposition The approach taken in this book is highly module theoretic and follows the modern flavor of the theory of finite dimensional algebras The content is divided into 7 parts Part I consists of 3 preliminary chapters with no prior knowledge beyond group theory assumed Part II forms the core of the material giving a modern module theoretic treatment of the Clifford Munn Ponizovskii theory of irreducible representations Part III concerns character theory and the character table of a monoid Part IV is devoted to the representation theory of inverse monoids and categories and Part V presents the theory of the Rhodes radical with applications to triangularizability Part VI features 3 chapters devoted to applications to diverse areas of mathematics and forms a high point of the text The last part Part VII is concerned with advanced topics There are also 3 appendices reviewing finite dimensional algebras group representation theory and Möbius inversion

A Course in Formal Languages, Automata and Groups Ian M. Chiswell, 2009-02-06 This book is based on notes for a master s course given at Queen Mary University of London in the 1998 9 session Such courses in London are quite short and the course consisted essentially of the material in the first three chapters together with a two hour lecture on connections with group theory Chapter 5 is a considerably expanded version of this For the course the main sources were the books by Hopcroft and Ullman 20 by Cohen 4 and by Epstein et al 7 Some use was also made of a later book by Hopcroft and Ullman 21 The ulterior motive in the first three chapters is to give a rigorous proof that various notions of recursively enumerable

language are equivalent Three such notions are considered These are generated by a type 0 grammar recognised by a Turing machine deterministic or not and defined by means of a Godel numbering having defined recursively enumerable for sets of natural numbers It is hoped that this has been achieved without too many arguments using complicated notation This is a problem with the entire subject and it is important to understand the idea of the proof which is often quite simple Two particular places that are heavy going are the proof at the end of Chapter 1 that a language recognised by a Turing machine is type 0 and the proof in Chapter 2 that a Turing machine computable function is partial recursive
