represented ranged from mathematics and information theory over various elds of engineering biochemistry and biology to the economic and social sciences All participants presented talks explaining the nature of structures considered in their elds and the associated procedures of analysis It soon became evident that the study of structures is indeed a common c cern of virtually all disciplines The motivation as well as the methods of analysis however differ considerably In engineering the generation of artifacts such as infrastructures or technological processes are of primary interest Frequently the analysis aims there at de ning a simpli ed mathematical model for the optimization of the structures and the structure generating processes Mathematical or heuristic methods are applied the latter preferably of the type of biology based evolutionary algorithms On the other hand setting up complex technical structures is not pos ble by such simpli ed model calculations but requires a different and less model but rather knowledge based type of approach using empirical rules rather than formal equations In biochemistry interest is frequently focussed on the structures of molecules such as proteins or ribonucleic acids Again optimal structures can usually be de ned
