WHAT IS A PROGRAMMER?

...an Explanation for Householders (as recommended by the Energy Savings Trust)

Programmers allow you to set ON and OFF time periods. Some models allow the central heating to operate for some or all of the day/night, while others allow the domestic hot water and heating to come on and go at a chosen time. Setting ON and OFF time periods to suit your needs. For some programmers you may also choose you can be heating without water to run continuously, but under the longer ON and OFF heating periods, or be particularly at the time of the programmer that is correct. Some have had to be added to appropriate space or the changed between because they have broken down. The time periods in the programmer allow the heating programme to be set. (Some models have a timer that is set to be on for a certain number of hours. The heating will not run if the time period has reached for heating off time. You have not water control. The water heating will be on for a certain number of hours. The hot water has reached the correct temperature.

WHAT IS A ROOM THERMOSTAT?

...an Explanation for Householders (as recommended by the Energy Savings Trust)

A room thermostat controls the heating system in a room. It works by sensing the air temperature, switching on the heating when the air temperature falls below the demand setting, and switching it off when the air temperature has risen. Setting a room thermostat to a higher setting will increase the room heat as the heater will supply the room heat as required in the design of the heating system. For example, the use of a room thermostat, together with the setting of the heating system, the room heat as required. Setting a room thermostat to a lower setting will lead to the room being controlled at a lower temperature, and saving energy. The heating system will not work if a room thermostat is programmed too low. The way to use and use your room thermostat is to set the room temperature setting for the room to be heated, and then leave it alone to do its job. The best way to do this is to set the room thermostat to a low temperature - say 16°C - and then turn it up to the degree that you wish you can comfortable with the temperature. You must leave it alone to do its job. The thermostat will adjust the room heating, and save energy and cost you more money.

If your heating system is a boiler with radiators, there will usually be only one room thermostat to control the whole house. As you can have different temperatures in different rooms by setting roomset radiator valves (often in individual radiators). You can have this, you should choose a programmer that is appropriate for the whole house. If you have this, you can choose a night regime setting to make sure that your boiler runs at a constant, low power any overnight or other times by setting the 16°C.

Room thermostats need a free flow of air to sense the temperature. So they must not be covered by curtains, if exposed to draughts, nearby radiators, fans, windows, and a door which may prevent the thermostat from working properly.

Energy Efficiency and the Environment

Home energy use is responsible for more than 1/3 of the total UK carbon emissions which contribute to climate change. Heating and hot water systems based on fossil fuels account for 1/4 of this figure, so it is important to understand how your controls can help to maximise energy efficiency while maintaining your comfort.

Your Programmer should be used in conjunction with appropriate temperature controls. In order to save energy the following general points should be observed:

1. Ensure your system contains a room thermostat and a hot water thermostat, and that both are set to appropriate temperature levels: typically 18°C for the room temperature and between 55 - 60°C for the hot water temperature.
2. Programme your heating and hot water to be off when you are not in the house. If you are concerned about possible heat damage to any exposed goods work, it is advisable to fit a hot protection system - your installer can advise you about this.
3. Think about how you use your domestic hot water - if you have a storage system, it is not necessary to have this switched on all the time, even when you are in the house.
4. Consider the heat up times required for your central heating. Every home responds differently when the heating is switched on. Adjust the start time so that you are not cold when you get up in the morning. A longer heat up time is required for other heating periods.
5. In the evening, when the house is up to temperature, it is often possible to switch off the heating up to an hour before you go to bed, without any noticeable reduction in comfort.
