Gliomas Valeria Barresi,Maria Caffo,Giuseppe Lombardi,Letteria Minutoli,Emeline Tabouret ,Herui Wang,2024-10-29

Cerebral gliomas account for 45% of all primary central nervous system CNS tumors The median survival after the initial diagnosis of glioblastoma GBM is only 15 months and less than 10% of patients survive three years post diagnosis Surgical treatment followed by adjuvant therapies such as radiotherapy and chemotherapy represents the classical strategy in glioma management The revised WHO 2016 classification now distinguishes the oligodendrogliomas with 1p19q codeletion and IDH mutation from the astrocytomas with or without IDH mutations thereby creating homogenous and pathologically distinct subgroups While the status of gene expression and mutations define components of GBM subtypes it was also found that response to therapies was different for each subtype suggesting that personalized treatment based on genomic alterations could lead to a more favorable outcome for this disease
