Domination Games Played on Graphs Boštjan Brešar, Michael A. Henning, Sandi Klavžar, Douglas F. Rall, 2021-04-15 This concise monograph presents the complete history of the domination game and its variants up to the most recent developments and will stimulate research on closely related topics establishing a key reference for future developments The crux of the discussion surrounds new methods and ideas that were developed within the theory led by the imagination strategy the Continuation Principle and the discharging method of Bujs to prove results about domination game invariants A toolbox of proof techniques is provided for the reader to obtain

results on the domination game and its variants Powerful proof methods such as the imagination strategy are presented The Continuation Principle is developed which provides a much used monotonicity property of the game domination number In addition the reader is exposed to the discharging method of Bujt s The power of this method was shown by improving the known upper bound in terms of a graph s order on the ordinary domination number of graphs with minimum degree between 5 and 50 The book is intended primarily for students in graph theory as well as established graph theorists and it can be enjoyed by anyone with a modicum of mathematical maturity The authors include exact results for several families of graphs present what is known about the domination game played on subgraphs and trees and provide the reader with the computational complexity aspects of domination games Versions of the games which involve only the slow player yield the Grundy domination numbers which connect the topic of the book with some concepts from linear algebra such as zero forcing sets and minimum rank More than a dozen other related games on graphs and hypergraphs are presented in the book In all these games there are problems waiting to be solved so the area is rich for further research The domination game belongs to the growing family of competitive optimization graph games The game is played by two competitors who take turns adding a vertex to a set of chosen vertices They collaboratively produce a special structure in the underlying host graph namely a dominating set The two players have complementary goals one seeks to minimize the size of the chosen set while the other player tries to make it as large as possible The game is not one that is either won or lost Instead if both players employ an optimal strategy that is consistent with their goals the cardinality of the chosen set is a graphical invariant called the game domination number of the graph To demonstrate that this is indeed a graphical invariant the game tree of a domination game played on a graph is presented for the first time in the literature
