Practical Guide to Handling Laser Diode Beams Haiyin Sun, 2015-02-20 This book offers the reader a practical guide to the control and characterization of laser diode beams. Laser diodes are the most widely used lasers accounting for 50% of the global laser market. Correct handling of laser diode beams is the key to the successful use of laser diodes and this requires an in depth understanding of their unique properties. Following a short introduction to the working principles of laser diodes the book describes the basics of laser diode beams and beam propagation including Zemax modeling of a Gaussian beam propagating through a lens. The core of the book is concerned with laser diode beam manipulations: collimating and focusing, circularization and astigmatism correction, coupling into a single mode optical fiber, diffractive optics and beam shaping and manipulation of multi transverse mode beams. The final chapter of the book covers beam characterization methods describing the measurement of spatial and spectral properties including wavelength and linewidth measurement techniques. The book is a significantly revised and expanded version of the title *Laser Diode Beam Basics: Manipulations and Characterizations* by the same author. New topics introduced in this volume include laser diode types and working principles, non paraxial Gaussian beam, Zemax modeling, numerical analysis of a laser diode beam, spectral property, characterization methods and power and energy characterization techniques. The book approaches the subject in a practical way with mathematical content kept to the minimum level required, making the book a convenient reference for laser diode users.

Optical Trapping And Manipulation Of Neutral Particles Using Lasers: A Reprint Volume With Commentaries Arthur Ashkin, 2006-12-29 This important volume contains selected papers and extensive commentaries on laser trapping and manipulation of neutral particles using radiation pressure forces. Such techniques apply to a variety of small particles such as atoms, molecules, macroscopic dielectric particles, living cells and organelles within cells. These optical methods have had a revolutionary impact on the fields of atomic and molecular physics, biophysics and many aspects of nanotechnology. In atomic physics the trapping and cooling of atoms down to nanokelvins and even picokelvin temperatures are possible. These are the lowest temperatures in the universe. This made possible the first demonstration of Bose-Einstein condensation of atomic and molecular vapors. Some of the applications are high precision atomic clocks, gyroscopes, the measurement of gravity, cryptography, atomic computers, cavity quantum electrodynamics and coherent atom lasers. A major application in biophysics is the study of the mechanical properties of the many types of motor molecules, mechanoenzymes and other macromolecules responsible for the motion of organelles within cells and the locomotion of entire cells. Unique in vitro and in vivo assays study the driving forces, stepping motion, kinetics and efficiency of these motors as they move along the cell's cytoskeleton. Positional and temporal resolutions have been achieved, making possible the study of RNA and DNA polymerases as they undergo their various copying, backtracking and error correcting functions on a single base pair basis. Many applications in nanotechnology involve particle and cell sorting, particle rotation, microfabrication of simple machines, microfluidics and other micrometer devices. The number of applications continues to grow at a rapid rate. The author is the discoverer of optical

trapping and optical tweezers With his colleagues he first demonstrated optical levitation the trapping of atoms and tweezer trapping and manipulation of living cells and biological particles This is the only review volume covering the many fields of optical trapping and manipulation The intention is to provide a selective guide to the literature and to teach how optical traps really work

The Practical Guides on Deep Learning Using SCIKIT-LEARN, KERAS, and TENSORFLOW with Python GUI

Vivian Siahaan, Rismon Hasiholan Sianipar, 2023-06-17

In this book you will learn how to use TensorFlow Keras Scikit Learn OpenCV Pandas NumPy and other libraries to implement deep learning on recognizing traffic signs using GTSRB dataset detecting brain tumor using Brain Image MRI dataset classifying gender and recognizing facial expression using FER2013 dataset

In Chapter 1 you will learn to create GUI applications to display image histogram It is a graphical representation that displays the distribution of pixel intensities in an image It provides information about the frequency of occurrence of each intensity level in the image The histogram allows us to understand the overall brightness or contrast of the image and can reveal important characteristics such as dynamic range exposure and the presence of certain image features

In Chapter 2 you will learn how to use TensorFlow Keras Scikit Learn Pandas NumPy and other libraries to perform prediction on handwritten digits using MNIST dataset The MNIST dataset is a widely used dataset in machine learning and computer vision particularly for image classification tasks It consists of a collection of handwritten digits from zero to nine where each digit is represented as a 28x28 grayscale image The dataset was created by collecting handwriting samples from various individuals and then preprocessing them to standardize the format Each image in the dataset represents a single digit and is labeled with the corresponding digit it represents The labels range from 0 to 9 indicating the true value of the handwritten digit

In Chapter 3 you will learn how to perform recognizing traffic signs using GTSRB dataset from Kaggle There are several different types of traffic signs like speed limits no entry traffic signals turn left or right children crossing no passing of heavy vehicles etc Traffic signs classification is the process of identifying which class a traffic sign belongs to In this Python project you will build a deep neural network model that can classify traffic signs in image into different categories With this model you will be able to read and understand traffic signs which are a very important task for all autonomous vehicles You will build a GUI application for this purpose

In Chapter 4 you will learn how to perform detecting brain tumor using Brain Image MRI dataset Following are the steps taken in this chapter

- Dataset Exploration Explore the Brain Image MRI dataset from Kaggle Describe the structure of the dataset the different classes tumor vs non tumor and any preprocessing steps required
- Data Preprocessing Preprocess the dataset to prepare it for model training This may include tasks such as resizing images normalizing pixel values splitting data into training and testing sets and creating labels
- Model Building Use TensorFlow and Keras to build a deep learning model for brain tumor detection Choose an appropriate architecture such as a convolutional neural network CNN and configure the model layers
- Model Training Train the brain tumor detection model using the preprocessed dataset Specify the loss function optimizer and evaluation metrics Monitor the training process and visualize

the training validation accuracy and loss over epochs

Model Evaluation

Evaluate the trained model on the testing dataset

Calculate metrics such as accuracy precision recall and F1 score to assess the model's performance

Prediction and Visualization

Use the trained model to make predictions on new MRI images

Visualize the predicted results alongside the ground truth labels to demonstrate the effectiveness of the model

Finally you will build a GUI application for this purpose

Chapter 5

Following are the steps taken in this chapter

Data Exploration

Load the dataset using Pandas perform exploratory data analysis EDA to gain insights into the data and visualize the distribution of gender classes

Data Preprocessing

Preprocess the dataset by performing necessary transformations such as resizing images converting labels to numerical format and splitting the data into training validation and test sets

Model Building

Use TensorFlow and Keras to build a gender classification model

Define the architecture of the model compile it with appropriate loss and optimization functions and summarize the model's structure

Model Training

Train the model on the training set monitor its performance on the validation set and tune hyperparameters if necessary

Visualize the training history to analyze the model's learning progress

Model Evaluation

Evaluate the trained model's performance on the test set using various metrics such as accuracy precision recall and F1 score

Generate a classification report and a confusion matrix to assess the model's performance in detail

Prediction and Visualization

Use the trained model to make gender predictions on new unseen data

Visualize a few sample predictions along with the corresponding images

Finally you will build a GUI application for this purpose

Chapter 6

you will learn how to perform recognizing facial expression using FER2013 dataset using CNN model

The FER2013 dataset contains facial images categorized into seven different emotions: anger, disgust, fear, happiness, sadness, surprise, and neutral

To perform facial expression recognition using this dataset you would typically follow these steps

Data Preprocessing

Load and preprocess the dataset

This may involve resizing the images converting them to grayscale and normalizing the pixel values

Data Split

Split the dataset into training validation and testing sets

The training set is used to train the model the validation set is used to tune hyperparameters and evaluate the model's performance during training and the testing set is used to assess the final model's accuracy

Model Building

Build a deep learning model using TensorFlow and Keras

This typically involves defining the architecture of the model selecting appropriate layers such as convolutional layers pooling layers and fully connected layers and specifying the activation functions and loss functions

Model Training

Train the model using the training set

This involves feeding the training images through the model calculating the loss and updating the model's parameters using optimization techniques like backpropagation and gradient descent

Model Evaluation

Evaluate the trained model's performance using the validation set

This can include calculating metrics such as accuracy precision recall and F1 score to assess how well the model is performing

Model Testing

Assess the model's accuracy and performance on the testing set which contains unseen data

This step helps determine how well the model generalizes to new unseen facial

expressions Prediction Use the trained model to make predictions on new images or live video streams This involves detecting faces in the images using OpenCV extracting facial features and feeding the processed images into the model for prediction Then you will also build a GUI application for this purpose
