

11.3 Locate and prepare tread measurement positions carefully in accordance with Test Method [F421](#). Mark and record these positions clearly. Renew the markings throughout the test to ensure that measurements are always made at the same locations.

11.4 If storage is required, place the mounted tires in locations that do not subject the tires to undesirable effects, for example, direct sunlight, extreme temperature, and ozone.

12. Preparation of Apparatus and Instruments

12.1 Preparation of Test Vehicle:

12.1.1 *Loading*—Adjust the vehicle load so that each test tire has the specified load $\pm 1\%$, with all wheel positions being measured simultaneously. Adjust vehicle load with mounted spare tire(s), necessary emergency and safety equipment, test instrumentation all stored in place, a 68 kg [150 lb] simulated driver, and a full fuel load.

12.1.2 *Alignment*—Align the wheels in accordance with the vehicle manufacturer's specifications after test loads have been installed. Deviation from vehicle manufacturer's specification based on experience may be used to ensure even tread wear across the tire.

12.1.3 Install the speed and distance recording equipment and verify that the instrumentation accuracy is in accordance with Test Method [F457](#).

13. Calibration of Measurement Equipment

13.1 Calibrate all measurement and test equipment in accordance with an established calibration procedure.

13.2 Establish procedures for using the measurement and test equipment under specific conditions to ensure their accuracy and stability.

13.3 Calibration instruments and standards shall be traceable to the National Institute of Standards and Technology.

13.4 Label all measuring and test equipment with the date of calibration and the name of the person who calibrated the equipment.

13.5 Maintain records of calibration for all measuring and test equipment to ensure maintenance of established calibration schedules.

14. Procedure

14.1 Install the test tires at the specified test positions of the specified test vehicle.

14.2 Adjust the cold tire inflation pressure to the specified value just prior to the start of the test.

14.3 If break-in is desired, it shall consist of one or more complete measurement intervals.

14.4 Inspect all tread grooves (or voids) and all rib or element surfaces. Note and describe any irregular wear. Record other external tire conditions such as checking, cracking, bead chafing, and external damage.

14.5 Measure each tire prior to the first test cycle and at the end of each subsequent, predetermined measurement interval. Record results as per test instructions.

14.6 Install the tire on the test vehicle in the position specified by the tire rotation schedule.

14.7 Check and record the inflation pressure and, if necessary, adjust to specified pressure when the tire is in temperature equilibrium with the environment.

14.8 Drive the test vehicle over the test course at the specified speed.

14.9 Measure the groove (or void) depths in accordance with Test Method [F421](#).

14.10 Record the measured values and inspection notes as per test instructions.

14.11 Repeat [14.6](#) through [14.10](#) until the required distance or groove (or void) depth has been achieved.

14.12 Certain measurements, although not directly applicable to a tread loss determination, are often of value in the analysis of data or in the monitoring and control of the test. Among these measurements are: tire weight, outside diameter, cross section width, overall width, outside diameter, cross-section width, tread radius (or profile), and tread hardness. These measurements are optional. (See Test Method [F1502](#)).
