How To Choose A Not Processor:

Multiprocessor Systems-on-Chips Ahmed Jerraya, Wayne Wolf, 2005 Modern system on chip SoC design shows a clear trend toward integration of multiple processor cores on a single chip Designing a multiprocessor system on chip MPSOC requires an understanding of the various design styles and techniques used in the multiprocessor Understanding the application area of the MPSOC is also critical to making proper tradeoffs and design decisions Multiprocessor Systems on Chips covers both design techniques and applications for MPSOCs Design topics include multiprocessor architectures processors operating systems compilers methodologies and synthesis algorithms and application areas covered include telecommunications and multimedia The majority of the chapters were collected from presentations made at the International Workshop on Application Specific Multi Processor SoC held over the past two years The workshop assembled internationally recognized speakers on the range of topics relevant to MPSOCs After having refined their material at the workshop the speakers are now writing chapters and the editors are fashioning them into a unified book by making connections between chapters and developing common terminology Examines several different architectures and the constraints imposed on them Discusses scheduling real time operating systems and compilers Analyzes design trade off and decisions in telecommunications and multimedia applications **The Complete Raw Workflow Guide** Philip

Faraboschi, 2005 Embedded Computing is enthralling in its clarity and exhilarating in its scope If the technology you are working on is associated with VLIWs or embedded computing then clearly it is imperative that you read this book If you are

involved in computer system design or programming you must still read this book because it will take you to places where the views are spectacular You don't necessarily have to agree with every point the authors make but you will understand what they are trying to say and they will make you think From the Foreword by Robert Colwell R E Colwell Assoc Inc The fact that there are more embedded computers than general purpose computers and that we are impacted by hundreds of them every day is no longer news What is news is that their increasing performance requirements complexity and capabilities demand a new approach to their design Fisher Faraboschi and Young describe a new age of embedded computing design in which the processor is central making the approach radically distinct from contemporary practices of embedded systems design They demonstrate why it is essential to take a computing centric and system design approach to the traditional elements of nonprogrammable components peripherals interconnects and buses These elements must be unified in a system design with high performance processor architectures microarchitectures and compilers and with the compilation tools debuggers and simulators needed for application development In this landmark text the authors apply their expertise in highly interdisciplinary hardware software development and VLIW processors to illustrate this change in embedded computing VLIW architectures have long been a popular choice in embedded systems design and while VLIW is a running theme throughout the book embedded computing is the core topic Embedded Computing examines both in a book filled with fact and opinion based on the authors many years of R D experience Features Complemented by a unique professional quality embedded tool chain on the authors website <http://www.vliw.org/book> Combines technical depth with real world experience Comprehensively explains the differences between general purpose computing systems and embedded systems at the hardware software tools and operating system levels Uses concrete examples to explain and motivate the trade offs
