

3. An electrical power transformer has a diameter  $D_1 = 0.6 \text{ m}$ , height  $H = 0.6 \text{ m}$  and is cooled by ethylene glycol which runs through a thin-walled tube of diameter  $d = 25 \text{ mm}$  coiled around the body. The transformer dissipates  $1.02 \text{ kW}$  and is designed to operate at a constant surface temperature  $T_s = 370 \text{ K}$ . The ethylene glycol enters near the transformer at an inlet temperature  $T_{m,i} = 330 \text{ K}$  and it can be assumed that all heat lost by the transformer goes into the coolant. See Section 8.7 from the textbook for reference.

- If the temperature of the ethylene glycol increases  $\Delta T = 20 \text{ K}$  before it exits, determine the mass flow rate  $\dot{m}$  (in  $\frac{\text{kg}}{\text{s}}$ ).
- Determine the total length  $L$  (in  $\text{m}$ ) of tubing needed to maintain operating conditions.

**Answer :**  $L = 3.09 \text{ m}$

**Note\*** in equation 8.76, the  $D$  variable is the diameter of the helical tube and the  $C$  variable is defined as the distance between tube cross-section centers despite the drawing in the book appearing to be the outer diameter.

**Applied Mechanics Reviews** ,1973      *NASA Technical Memorandum* ,1977      *Transport Phenomena Fundamentals*

Joel L. Plawsky, 2020-02-27 The fourth edition of Transport Phenomena Fundamentals continues with its streamlined approach to the subject based on a unified treatment of heat mass and momentum transport using a balance equation approach. The new edition includes more worked examples within each chapter and adds confidence building problems at the end of each chapter. Some numerical solutions are included in an appendix for students to check their comprehension of key concepts. Additional resources online include exercises that can be practiced using a wide range of software programs available for simulating engineering problems such as COMSOL Maple Fluent Aspen Mathematica Python and MATLAB lecture notes and past exams. This edition incorporates a wider range of problems to expand the utility of the text beyond chemical engineering. The text is divided into two parts which can be used for teaching a two term course. Part I covers the balance equation in the context of diffusive transport momentum energy mass and charge. Each chapter adds a term to the balance equation highlighting that term's effects on the physical behavior of the system and the underlying mathematical description. Chapters familiarize students with modeling and developing mathematical expressions based on the analysis of a control volume, the derivation of the governing differential equations and the solution to those equations with appropriate boundary conditions. Part II builds on the diffusive transport balance equation by introducing convective transport terms focusing on partial rather than ordinary differential equations. The text describes paring down the full microscopic equations governing the phenomena to simplify the models and develop engineering solutions and it introduces macroscopic versions of the balance equations for use where the microscopic approach is either too difficult to solve or would yield much more information than is actually required. The text discusses the momentum Bernoulli energy and species continuity equations including a brief description of how these equations are applied to heat exchangers continuous contactors and chemical reactors. The book introduces the three fundamental transport coefficients: the friction factor, the heat transfer coefficient and the mass transfer coefficient in the context of boundary layer theory. Laminar flow situations are treated first followed by a discussion of turbulence. The final chapter covers the basics of radiative heat transfer including concepts such as blackbodies graybodies radiation shields and enclosures.
