

The Front Control. (Cut No. 2)

fire may injure the arm of the operator. When the engine is cool it is advisable to prime the carburetor by pulling on the small wire at the lower left corner of the radiator while giving the engine two or three quarter turns with the starting handle.

How is the Engine best started in cold weather?

Answer No. 8

As gasoline does not vaporize readily in cold weather it is naturally more difficult to start the motor under such conditions. The usual method of starting the engine when cold is to turn the carburetor dash adjustment one-quarter turn to the left in order to allow a richer mixture of gasoline to be drawn into the cylinders; then hold out the priming rod, which projects through the radiator, while you turn crank from six to eight one-quarter turns in quick succession. Another method of starting a troublesome cold engine is as follows: Before you throw on the magneto switch, (1) close throttle lever; (2) hold out priming rod while you give crank several quick turns, then let go of priming rod (being careful that it goes back all the way); (3) place spark lever in about third notch and advance throttle lever several notches; (4) throw on switch (being sure to get it on side marked "Magneto"); (5) give crank one or two turns, and the motor should start. After starting the motor it is advisable to advance the spark right or ten notches on the quadrant and let the motor run until thoroughly heated up. If you start out with a cold motor you will not have much power and are liable to "stall." The advantage of turning on the switch last, or after priming, is that when you throw on the switch and give the crank one-quarter turn, you have plenty of gas in the cylinders, to keep the motor running, thereby eliminating the trouble of the motor starting and stopping. After motor is warmed up turn carburetor adjustment back one-quarter turn.

To facilitate starting many drivers make a practice of stopping their engine by walking around in front of the car and pulling out on the priming rod, which has the effect of shutting off the air action and filling the cylinders full of a very rich gasoline vapor. This should not be done unless the car is going to stand over night or long enough to cool off. If the motor is stopped in this way and then started when hot, starting is apt to be difficult on account of the surplus gasoline in the carburetor.

How do the Foot Pedals operate?

Answer No. 9

The first one toward the left operates the clutch and by it the car is started and its operation largely controlled. When pressed forward the clutch pedal engages the low speed gear. When half way forward the gears are in neutral (i. e., disconnected from the driving mechanism of the car wheels), and, with the hand lever thrown forward, the releasing of this pedal engages the high speed clutch. The center pedal operates the reverse clutch. The right hand pedal operates the transmission brake. (See Cut No. 1.)
