Bayesian Estimation and Inference in Computational Anatomy and Neuroimaging: Methods & Applications Xiaoying Tang, Thomas Fletcher, Michael I. Miller, 2019-08-22

Computational Anatomy (CA) is an emerging discipline aiming to understand anatomy by utilizing a comprehensive set of mathematical tools CA focuses on providing precise statistical encodings of anatomy with direct application to a broad range of biological and medical settings During the past two decades there has been an ever increasing pace in the development of neuroimaging techniques delivering in vivo information on the anatomy and physiological signals of different human organs through a variety of imaging modalities such as MRI x ray CT and PET These multi modality medical images provide valuable data for accurate interpretation and estimation of various biological parameters such as anatomical labels disease types cognitive states functional connectivity between distinct anatomical regions as well as activation responses to specific stimuli In the era of big neuroimaging data Bayes theorem provides a powerful tool to deliver statistical conclusions by combining the current information and prior experience When sufficiently good data is available Bayes theorem can utilize it fully and provide statistical inferences estimations with the least error rate Bayes theorem arose roughly three hundred years ago and has seen extensive application in many fields of science and technology including recent neuroimaging ever since The last fifteen years have seen a great deal of success in the application of Bayes theorem to the field of CA and neuroimaging That said given that the power and success of Bayes rule largely depends on the validity of its probabilistic inputs it is still a challenge to perform Bayesian estimation and inference on the typically noisy neuroimaging data of the real world We assembled contributions focusing on recent developments in CA and neuroimaging through Bayesian estimation and

inference in terms of both methodologies and applications It is anticipated that the articles in this Research Topic will provide a greater insight into the field of Bayesian imaging analysis

**River Sand Mining Modelling and Sustainable Practice** Raj Kumar Bhattacharya, Nilanjana Das Chatterjee, 2021-07-31 Worldwide demand for sand and gravel is increasing daily as the need for these materials continues to rise for example in the construction sector in land filling and for transportation sector based infrastructural projects This results in over extraction of sand from channel beds and hampers the natural renewal of sediment geological setup and morphological processes of the riverine system In India illegal sand mining of alluvial channels and gravel mining of perennial channels are two anthropogenic issues that negatively affect the sustainable drainage system Along the Kangsabati River in India the consequences of sand mining are very serious The construction of Mukutmonipur Dam 1958 on the river causes huge sediment deposition along the middle and downstream areas these same areas are also intensely mined for sand instream and on the flood plain Geospatial models are applied in order to better understand the state and the resilience of stream hydraulics morphological and river ecosystem variables during pre mining and post mining stages using micro level datasets of the Kangsabati River The book also includes practicable measures to minimize the environmental consequences of instream mining in respect to optimum sand mining It discusses the threshold limits of each variable in stream hydraulics morphological and river ecological regime and also discusses the most affected variables Consequently all outputs will be very useful for students researchers academicians decision makers and practitioners and will facilitate applying these techniques to create models for other river basins
