

## Magnetism

### What is a Magnet?

A magnet is something that can attract metal or another magnet. A magnet can also repel another magnet.

### Properties of magnets:

- Magnets have two opposite poles: north and south.
- If divided, each part of a magnet will also have a north and south pole (you can never make an unpaired pole)
- Magnets exert forces on other magnets, called "Magnetic forces"
- Opposite poles attract (North attracts South)  
 Like poles repel (North repels North, etc)

### Permanent and Temporary Magnets

*Iron makes the best temporary magnets.  
 Only lodestone and magnetite are permanent magnets.*

**Permanent magnet** – a magnet that retains its magnetism and does not need to be "recharged." *Lodestone* and *magnetite* are the only two permanent magnetic substances.

**Temporary magnet** – a magnet that occurs when near a permanent magnet, but loses its magnetism away from the permanent magnet, many metals can be temporary magnets.

### Electromagnets

**Electromagnet**—a magnet made from electricity. When electricity moves it causes magnetism.

**Best use of an electromagnet**—we can turn it on and off.  
 Toasters, doorbells: any job needing a force on command needs an electromagnet.

#### A simple electromagnet

#### Strengthening an electromagnet –

- Increase electricity*  
 – more batteries or stronger battery.
- Increase number of coils*  
 – actually adds electricity, too.
- Add iron to the core* (center of electromagnetic)  
 – the iron amplifies the electromagnetic field.

**Second best use of an electromagnet**  
 —we can control how much force we need by increasing or decreasing the electricity.

### How do Magnets Work?

#### *Spinning electrons cause magnetism.*

**Permanent magnets**—all of the electrons in an atom are spinning the same way and the little electromagnetic add up.

**Temporary magnets**—the electrons can switch to spin in the same way when near a magnet, but will fall back after the magnet leaves.

Any magnet will reach inside the magnetic field (the arrows)

The arrows show the direction a North pole would move in the magnetic field.

### Magnetic Fields

**Magnetic Field**—the area in which a magnet or piece of metal feels the force of another magnet.

#### *Rules for magnetic fields—*

- drawn from North pole to South pole;
- closer or more arrows = stronger field.
- any magnet will react in a magnetic field.
- every magnet creates a magnetic field.

The magnet of a compass reacts to the Earth's magnetic field to point to magnetic north (in Canada), not true north (the North Pole).
