OPERATING PRINCIPLE

Figures 1 and 2 illustrate the simple and foolproof Magnetrol operating principle. Switching action is obtained through the use of a magnetic attracting sleeve, actuated by a float, and a switching mechanism. These two basic component assemblies are separated by a non-magnetic, pressure tight enclosing tube. The switch and magnet are assembled to a swinging arm which operates on precision stainless steel pivot sockets.

Falling Level

Figure 2

OPERATING CYCLE

At "Normal Operating Level" of liquid in the chamber (Figure 1), the float moves the magnetic attracting sleeve up the enclosing tube and into the field of the switch mechanism magnet. As a result, the magnet is drawn in tightly to the enclosing tube causing the switch to actuate, "making" or "breaking" an electrical circuit. As liquid level recedes, the float pulls the magnetic attracting sleeve downward until, at a pre-determined "Low Level" (Figure 2), the switch magnet releases and is drawn outward away from the enclosing body of the tube by a tension spring. This in turn deactuates the switch. When liquid level returns to normal (Figure 1), the float once again moves the magnetic attracting sleeve up at the enclosing tube, causing the switch to assume its original position.
