Modelling Dynamics in Processes and Systems Wojciech Mitkowski, 2009-06-01 Dynamics is what characterizes virtually all phenomena we face in the real world and processes that proceed in practically all kinds of inanimate and animate systems notably social systems For our purposes dynamics is viewed as time evolution of some characteristic features of the phenomena or processes under consideration It is obvious that in virtually all non trivial problems dynamics can not be neglected and should be taken into account in the analyses to first get insight into the problem consider and second to be able to obtain meaningful results A convenient tool to deal with dynamics and its related evolution over time is to use the concept of a dynamic system which for the purposes of this volume can be characterized by the input control state and output spaces and a state transition equation Then starting from an initial state we can find a sequence of consecutive states outputs under consecutive inputs controls That is we obtain a trajectory The state transition equation may be given in various forms exemplified by differential and difference equations linear or nonlinear deterministic or stochastic or even fuzzy imprecisely specified fully or partially known etc These features can give rise to various problems the analysts may encounter like numerical difficulties instability strange forms of behavior e g chaotic etc This volume is concerned with some modern tools and techniques which can be useful for the modeling of dynamics We focus our attention on two important areas which play a key role nowadays namely automation and robotics and biological systems We also add some new applications which can greatly benefit from the availability of effective and efficient tools for modeling dynamics exemplified by some applications in security systems
