Conservation Monitoring in Freshwater Habitats Clive Hurford, Michael Schneider, Ian Cowx, 2009-12-09 As in the terrestrial environment most data collection from freshwater habitats to date falls into the survey surveillance or research categories The critical difference between these exercises and a monitoring project is that a monitoring project will clearly identify when we need to make a management response A Model for Conservation Management and Monitoring Monitoring as defined by Hellawell is essentially a tool of practical conservation management and Fig 1 1 shows a simple but effective model for nature conservation management and monitoring The need for clear decision making is implicit in this model First we must decide what would represent a favourable state for the key habitat or species and then we must decide when to intervene if the state is or becomes unfavourable A third often

overlooked but equally important decision concerns when we would consider the habitat or species to have recovered this is unlikely to be the same point that we became concerned about it This decision not only has resource implications it can also have major implications for other habitats and species prey species are an obvious example All of these decisions are essential to the development of an efficient and effective monitoring project
