

## UNIT 5: Structure and Function of Organisms, Part 2

### Lesson 1: Physical and Chemical Changes in Digestion

#### DID YOU KNOW?

Hydrochloric acid breaks down food and also kills bacteria and viruses that are ingested with the food.

The chyme moves into the small intestine, and different digestive enzymes from the liver and pancreas continue breaking the molecules down. Approximately 6–8 hours after the food enters the mouth, it has been physically and chemically broken down into simple molecules that are easily absorbed into the blood through the small intestine's villi. The circulatory system then transports the digested food to the cells of the body.

Villi increase the surface area in the intestines for nutrient absorption.

Dangerous metabolic by-products such as hydrogen peroxide are chemically changed into less harmful substances by enzymes. Indigestible parts of chyme are moved along to the large intestine, where usable water and minerals are absorbed. Unusable waste material is expelled from the anus.

Create a table similar to the one below that describes whether physical changes, chemical changes, or both physical and chemical changes occur in each organ.

Organ	Physical, Chemical, or Physical and Chemical Changes
mouth	
esophagus	
stomach	
small intestine	
large intestine
