The TVs of

Tomorrow Benjamin Gross, 2018-03-22 In 1968 a team of scientists and engineers from RCA announced the creation of a new form of electronic display that relied upon an obscure set of materials known as liquid crystals At a time when televisions utilized bulky cathode ray tubes to produce an image these researchers demonstrated how liquid crystals could electronically control the passage of light One day they predicted liquid crystal displays would find a home in clocks calculators and maybe even a television that could hang on the wall Half a century later RCA's dreams have become a reality and liquid crystals are the basis of a multibillion dollar global industry Yet the company responsible for producing the first LCDs was unable to capitalize upon its invention In *The TVs of Tomorrow* Benjamin Gross explains this contradiction by examining the history of flat panel display research at RCA from the perspective of the chemists physicists electrical engineers and technicians at the company's central laboratory in Princeton New Jersey Drawing upon laboratory notebooks internal reports and interviews with key participants Gross reconstructs the development of the LCD and situates it alongside other efforts to create a thin lightweight replacement for the television picture tube He shows how RCA researchers mobilized their technical expertise to secure support for their projects He also highlights the challenges associated with the commercialization of liquid crystals at RCA and Optel the RCA spin off that ultimately manufactured the first LCD wristwatch *The TVs of Tomorrow* is a detailed portrait of American innovation during the Cold War which confirms that success in the electronics industry hinges upon input from both the laboratory and the boardroom
