

Digestive System

Mouth

Salivary enzymes begin carbohydrate digestion and break up food particles.

Pharynx

Directs food into the stomach to prevent choking.

Liver

The largest organ inside the body. Makes bile (fluid that helps break down fats and gets rid of wastes in the body); changes food into energy; and clears alcohol, some medicines, and poisons from the blood. Stores vitamins and iron. Destroys old blood cells.

Gallbladder

Stores the bile made in the liver, then empties it into the small intestine to help digest fats. Stones can form within.

Small intestine

Digests protein, fats and carbohydrates. Bacterial metabolism plus nutrient and excess water absorption. Surface is covered in villi for greater absorption. Site of fructose malabsorption and Coeliac disease.

Appendix

A pouch attached to the first part of the large intestine. No one knows its function.

Anus

The opening at the end of the digestive tract where bowel movements leave the body.

Salivary glands

Moistens and lubricates food. The enzyme amylase digests carbohydrates.

Oesophagus

Carries food down from the mouth to the stomach.

Stomach

Secretes gastric juice and hydrochloric acid, and activates enzymes, continues to breakdown food and kill off any pathogens. Stores and churns food. Enzyme pepsin digests protein.

Pancreas

A gland that makes enzymes for digestion, and bicarbonate to neutralize stomach acid. Also makes the hormone insulin, which helps the body turn food into energy, and regulates blood sugar levels.

Large intestine

Also called the colon. It absorbs water and electrolytes from stool. It also contains beneficial bacteria which help produce certain vitamins. Forms and stores faeces.

Rectum

The lower end of the large intestine, leading to the anus. Stores and expels faeces.
