24. Possible answers: the course toward its destination, the depth of the water in which it can sail, the angle of the turn it can make safely
25. a negative feedback loop

Short Answer

16. Acid is released.
17. The upper loop is a negative feedback loop. The pH is the set point. Food entering triggers the release of gastrin, which leads to the release of more acid, which leads to a lower pH. Then the loop restores homeostasis because the lower pH inhibits the release of gastrin and acid. As a result, the pH level rises again.
18. the lower pH of the stomach
19. The lower loop shows a positive feedback loop, because the release of pepsin leads to the release of more pepsin, moving conditions away from a set point.
20. A higher pH would stop the production of pepsin. That would occur after the gastrin was inhibited. If no more food entered the system, the gastrin release would stop and the pH would stay at a higher level.
