

*A simplified version of a DNA molecule.*

### Mitosis:

Mitosis is a process of separating a cell into two with identical sets of chromosomes. This occurs during growth, repair, cloning and asexual reproduction.

1. Prophase - the cell duplicates its DNA.
2. Metaphase - the centrioles (duplicated DNA) align themselves along the equator (middle) and send out tubules that connect to the centromere and connect the two strands of chromosomes (condensed DNA).
3. Anaphase - half of the chromosomes are pulled one way and vice versa.
4. Telophase - cell membranes close in and split the cell.

### The organisation of cells:

Specialised cells that perform similar functions are grouped together as tissues:

There are many types of tissues:

1. Bones - collection of cells that secrete calcium salts.
2. Muscle - these can be voluntary, involuntary or also cardiac.
