This Bulletin covers AP50 and AP60 models which are identified by a grey plastic Electronic Module with a black printed label showing a vehicle speedometer image in the lower left corner. This module would normally be mounted behind the vehicle dashboard and has the Cruise Control wiring harness connected with a multi pin plug. If you can locate two Brown wires (one with a White trace line) at the vehicle brake lamp switch they will lead you to this module.

Before we discuss the test procedure there are some important points we should verify. Command Cruise Controls are designed for 12 volt (not 6 or 24 volt) passenger cars, light commercials and four wheel drive vehicles. The gross (loaded) weight of the vehicle should not exceed 4 tonnes. *We cannot provide technical support or advice for vehicles outside these specifications, or for fitment to motorcycles, boats, stationary engines or other applications. Further, Command Cruise Controls are not suitable for very low speed use such as crop spraying, but are designed to engage in 40kmh School Speed Limit zones as a minimum. If you have purchased a kit for non-specified fitment please do not proceed as the unit will not operate.*

If you have fitted a Cruise Control and found it will not engage on a road test please firstly review the following.

THE IMPORTANCE OF THE VEHICLE BRAKE LIGHT CIRCUIT

Our Diagnostic Test will check correct operation of the brake pedal switch but not the circuit resistance value, so have you stood at the rear of vehicle while another person presses the brake pedal and checked all brake lights are working? A blown brake light bulb or circuit fault will prevent the Cruise Control from engaging. Have you also checked that main brake lamps are bulb-type and not LEDs? If your

Cooperative Adaptive Cruise Control Human Factors Study Vaughan W. Inman,Steven Jackson,Brian H. Philips,2016 This study set out to examine the following diverse questions regarding cooperative adaptive cruise control CACC use Does CACC reduce driver workload relative to manual gap control Does CACC increase the probability of driver distraction relative to manual gap control Does CACC result in reduced driver arousal relative to manual gap control Does CACC result increase the ability to avoid a crash when exposed to an extreme breaking event Will drivers trust the CACC system These questions were addressed in an experiment conducted in the Federal Highway Administration Highway Driving Simulator A total of 49 licensed drivers were tested with 12 or 13 participants in each of 4 groups All of the groups drove in the third position in a five vehicle platoon in which all of the other vehicles were equipped with simulated CACC The groups differed as to whether the participant vehicle was equipped with CACC and the type of event at the end of the drive that

disturbed the longitudinal spacing of the platoon As assessed by the National Aeronautics and Space Administration Task Load Index the CACC system did reduce perceived driver workload relative to driving without cruise control CACC users appeared slightly more likely to engage in diversionary activities e g listening to the car radio than control group drivers CACC yielded a substantial and statistically reliable reduction in the probability of a crash No evidence was obtained to suggest that use of CACC leads to lower levels of driver arousal than manual gap control Participants showed a great deal of trust in the CACC system In a situation where all of the control participants used the brake to maintain a comfortable gap only 2 of 36 CACC users overrode the system with the brake or accelerator *Intelligent Cruise Control Field Operational Test, Final Report, Volume II: Appendices A - F*, 1998 Repair and Testing VDO Cruise Control for Mercedes R107 W126 W124 W201 R107 Schrauber, Jochen Jahn, 2024-01-22 Cruise control tests with repair of the control unit Detailed instructions on the various tests and also repairs on the electronically controlled cruise controls from VDO from the 80s and 90s For the Mercedes Benz models R107 W126 W124 W201 **Summary Report** Vaughan W. Inman, Stacy A. Balk, Steven Jackson, Brian H. Philips, 2017 This summary report provides a high level overview of four experiments that investigated human factors issues surrounding cooperative adaptive cruise control CACC CACC combines three driver assist systems 1 conventional cruise control which automatically maintains the speed a driver has set 2 adaptive cruise control which uses radar or light detection and ranging sensors to automatically maintain a gap the driver has selected between the driver's vehicle and a slower moving vehicle ahead and 3 dedicated short range communications to transmit and receive data with surrounding vehicles so that the cruise control system can more quickly respond to changes in speed and location of other CACC vehicles even vehicles that the driver cannot see This report describes a series of experiments that examined how use of a CACC affected drivers workload propensity to distraction level of physiological arousal ability to avoid a crash merging abilities and trust in the system The first experiment compared driving with CACC in a string of four or five vehicles with manual control of the following distance in the same strings The second experiment explored driver performance when merging into a string of CACC vehicles The third experiment took a closer look at the source of a substantial crash reduction benefit obtained with CACC in the first experiment The fourth experiment examined the effect of a driver's preferred following distance on performance and workload when using short and long CACC gap settings
