Deep Learning Methods and Applications in Brain Imaging for the Diagnosis of Neurological and Psychiatric Disorders Hao Zhang, Da Ma, Lei Wang, 2024-10-14 Brain imaging has been successfully used to generate image based biomarkers for various neurological and psychiatric disorders such as Alzheimer's and related dementias Parkinson's disease stroke traumatic brain injury brain tumors depression schizophrenia etc However accurate brain image based diagnosis at the individual level remains elusive and this applies to the diagnosis of neuropathological diseases as well as clinical syndromes In recent years deep learning techniques due to their ability to learn complex patterns from large amounts of data have had remarkable success in various fields such as computer vision and natural language processing Applying deep learning methods to brain imaging assisted diagnosis while promising is facing challenges such as insufficiently labeled data difficulty in interpreting diagnosis results variations in data acquisition in multi site projects integration of multimodal data clinical heterogeneity etc The goal of this research topic is to gather cutting edge research that showcases the application of deep learning methods in brain imaging for the diagnosis of neurological and psychiatric disorders We encourage submissions that demonstrate novel approaches to overcome various abovementioned difficulties and achieve more accurate reliable generalizable and interpretable diagnosis of neurological and psychiatric disorders in this field

Landmarking and Segmentation of 3D CT Images Shantanu Banik, Rangaraj Rangayyan, Graham Boag, 2022-06-01 Segmentation and landmarking of computed tomographic CT images of pediatric patients are important and useful in computer aided diagnosis CAD treatment planning and objective analysis of normal as well as pathological regions Identification and segmentation of organs and tissues in the presence of tumors are difficult Automatic segmentation of the primary tumor mass in neuroblastoma could facilitate reproducible and objective analysis of the tumor's tissue composition shape and size However due to the heterogeneous tissue composition of the neuroblastic tumor ranging from low attenuation necrosis to high attenuation calcification segmentation of the tumor mass is a challenging problem In this context methods are described in this book for identification and segmentation of several abdominal and thoracic landmarks to assist in the segmentation of neuroblastic tumors in pediatric CT images Methods to identify and segment automatically the peripheral artifacts and tissues the rib structure the vertebral column the spinal canal the diaphragm and the pelvic surface are described Techniques are also presented to evaluate quantitatively the results of segmentation of the vertebral column the spinal canal the diaphragm and the pelvic girdle by comparing with the results of independent manual segmentation performed by a radiologist The use of the landmarks and removal of several tissues and organs are shown to assist in limiting the scope of the tumor segmentation process to the abdomen to lead to the reduction of the false positive error and to improve the result of segmentation of neuroblastic tumors
