

The description of a dilation includes the scale factor and the center of dilation.

$D_{O, \frac{1}{3}}$
 center ← scale factor

If the scale factor, k , is greater than 1, the dilation is called an expansion.

If the scale factor, k , is between 0 and 1, the dilation is called a contraction.

Properties Preserved
Under a Dilation:

1. angle measures
2. parallel lines
3. collinear points
4. midpoints
5. orientation

Dilations create
similar figures.

Example - Find the image of $\triangle ABC$ under the dilation $D_{O, 2}$.

$A(-1, 0)$, $B(2, 2)$, $C(3, -2)$

$A'(-2, 0)$, $B'(4, 4)$, $C'(6, -4)$

Example - Find the image of $\triangle ABC$ under the dilation $D_{O, \frac{1}{2}}$.

$A(-2, 0)$, $B(2, 4)$, $C(4, -4)$

$A'(1, 0)$, $B'(-1, -2)$, $C'(-2, 2)$

Subgeometries Edward John Specht, Harold Trainer Jones, Keith G. Calkins, Donald H. Rhoads, 2015-12-31 In this monograph the authors present a modern development of Euclidean geometry from independent axioms using up to date language and providing detailed proofs The axioms for incidence betweenness and plane separation are close to those of Hilbert This is the only axiomatic treatment of Euclidean geometry that uses axioms not involving metric notions and that explores congruence and isometries by means of reflection mappings The authors present thirteen axioms in sequence proving as many theorems as possible at each stage and in the process building up subgeometries most notably the Pasch and neutral geometries Standard topics such as the congruence theorems for triangles embedding the real numbers in a line and coordinatization of the plane are included as well as theorems of Pythagoras Desargues Pappas Menelaus and Ceva The final chapter covers consistency and independence of axioms as well as independence of definition properties There are over 300 exercises solutions to many of these including all that are needed for this development are available online at the homepage for the book at www.springer.com Supplementary material is available online covering construction of complex numbers arc length the circular functions angle measure and the polygonal form of the Jordan Curve theorem Euclidean Geometry and Its Subgeometries is intended for advanced students and mature mathematicians but the proofs are thoroughly worked out to make it accessible to undergraduate students as well It can be regarded as a completion updating and expansion of Hilbert's work filling a gap in the existing literature Euclidean, Non-Euclidean, and Transformational Geometry Shlomo Libeskind, Isa S. Jubran, 2024-10-22 This undergraduate textbook provides a comprehensive treatment of Euclidean and transformational geometries supplemented by substantial discussions of topics from various non Euclidean and less commonly taught geometries making it ideal for both mathematics majors and pre service teachers Emphasis is placed on developing students deductive reasoning skills as they are guided through proofs constructions and solutions to problems The text frequently emphasizes strategies and heuristics of problem solving including constructing proofs Where to begin How to proceed Which approach is more promising Are there multiple solutions proofs etc This approach aims not only to enable students to successfully solve unfamiliar problems on their own but also to impart a lasting appreciation for mathematics The text first explores at a higher level and in much greater depth topics that are normally taught in high school geometry courses definitions and axioms congruence circles and related concepts area and the Pythagorean theorem similarity isometries and size transformations and composition of transformations Constructions and the use of transformations to carry out constructions are emphasized The text then introduces more advanced topics dealing with non

Euclidean and less commonly taught topics such as inversive hyperbolic elliptic taxicab fractal and solid geometries By examining what happens when one or more of the building blocks of Euclidean geometry are altered students will gain a deeper understanding of and appreciation for Euclidean concepts To accommodate students with different levels of experience in the subject the basic definitions and axioms that form the foundation of Euclidean geometry are covered in Chapter 1 Problem sets are provided after every section in each chapter and include nonroutine problems that students will enjoy exploring While not necessarily required the appropriate use of freely available dynamic geometry software and other specialized software referenced in the text is strongly encouraged this is especially important for visual learners and for forming conjectures and testing hypotheses

Transformation Geometry George E. Martin,2012-12-06 Transformation geometry is a relatively recent expression of the successful venture of bringing together geometry and algebra The name describes an approach as much as the content Our subject is Euclidean geometry Essential to the study of the plane or any mathematical system is an under standing of the transformations on that system that preserve designated features of the system Our study of the automorphisms of the plane and of space is based on only the most elementary high school geometry In particular group theory is not a prerequisite here On the contrary this modern approach to Euclidean geometry gives the

concrete examples that are necessary to appreciate an introduction to group theory Therefore a course based on this text is an excellent prerequisite to the standard course in abstract algebra taken by every undergraduate mathematics major An advantage of having nb college mathematics prerequisite to our study is that the text is then useful for graduate mathematics courses designed for secondary teachers Many of the students in these classes either have never taken linear algebra or else have taken it too long ago to recall even the basic ideas It turns out that very little is lost here by not assuming linear algebra A preliminary version of the text was written for and used in two courses one was a graduate course for teachers and the other a sophomore course designed for the prospective teacher and the general mathematics major taking one course in geometry
