The Global Geometry of Turbulence Javier Jiménez, 2012-12-06 The aim of this Advanced Research Workshop was to bring together Physicists Applied Mathematicians and Fluid Dynamicists including very specially experimentalists to review the available knowledge on the global structural aspects of turbulent flows with an especial emphasis on open systems and to try to reach a consensus on their possible relationship to recent advances in the understanding of the behaviour of low dimensional dynamical systems

and amplitude equations A lot has been learned during recent years on the non equilibrium behaviour of low dimensional dynamical systems including some fluid flows Rayleigh Benard Taylor Couette etc These are mostly closed flows and many of the global structural features of the low dimensional systems have been observed in them including chaotic behaviour period doubling intermit tency etc It has also been shown that some of these flows are intrinsically low dimensional which accounts for much of the observed similarities Open flows seem to be different and experimental observations point to an intrinsic high dimensionality However some of the tran sitional features of the low dimensional systems have been observed in them specially in the intermittent behaviour of subcritical flows pipes channels boundary layers with suction etc and in the large scale geometry of coherent structures of free shear flows mixing layers jets and wakes *Reader's Index and Guide* ,
