Genomes and What to Make of Them Barry Barnes,John Dupré,2009-05-15 The announcement in 2003 that the Human Genome Project had completed its map of the entire human genome was heralded as a stunning scientific breakthrough our first full picture of the basic building blocks of human life Since then boasts about the benefits and warnings of the dangers of genomics have remained front page news with everyone agreeing that genomics has the potential to radically alter life as we know it For the nonscientist the claims and counterclaims are dizzying what does it really mean to understand the genome Barry Barnes and John Dupr offer an answer to that question and much more in *Genomes and What to Make of Them* a clear and lively account of the genomic revolution and its promise The book opens with a brief history of

the science of genetics and genomics from Mendel to Watson and Crick and all the way up to Craig Venter from there the authors delve into the use of genomics in determining evolutionary paths and what it can tell us for example about how far we really have come from our ape ancestors Barnes and Dupr then consider both the power and risks of genetics from the economic potential of plant genomes to overblown claims that certain human genes can be directly tied to such traits as intelligence or homosexuality Ultimately the authors argue we are now living with a new knowledge as powerful in its way as nuclear physics and the stark choices that face us between biological warfare and gene therapy a new eugenics or a new agricultural revolution will demand the full engagement of both scientists and citizens Written in straightforward language but without denying the complexity of the issues *Genomes and What to Make of Them* is both an up to date primer and a blueprint for the future

Out of Eden: The Peopling of the World Stephen Oppenheimer, 2012-03-01 In a brilliant synthesis of genetic archaeological linguistic and climatic data Oppenheimer challenges current thinking with his claim that there was only one successful migration out of Africa In 1988 Newsweek headlined the startling discovery that everyone alive on the earth today can trace their maternal DNA back to one woman who lived in Africa 150 000 years ago It was thought that modern humans populated the world through a series of migratory waves from their African homeland Now an even more radical view has emerged that the members of just one group are the ancestors of all non Africans now alive and that this group crossed the mouth of the Red Sea a mere 85 000 years ago It means that not only is every person on the planet descended from one African Eve but every non African is related to a more recent Eve from that original migratory group This is a revolutionary new theory about our origins that is both scholarly and entertaining a remarkable account of the kinship of all humans Further details of the findings in this book are presented at www.bradshawfoundation.com
