Journal Of Malaria Parasite:

Malaria Parasites Omolade Okwa,2012-03-30 Malaria is a global disease in the world today but most common in the poorest countries of the world with 90% of deaths occurring in sub Saharan Africa This book provides information on global efforts made by scientist which cuts across the continents of the world Concerted efforts such as symbiont based malaria control new applications in avian malaria studies development of humanized mice to study *P falciparum* the most virulent species of malaria parasite and current issues in laboratory diagnosis will support the prompt treatment of malaria Research is ultimately gaining more grounds in the quest to provide vaccine for the prevention of malaria The book features research aimed to bring a lasting solution to the malaria problem and what we should be doing now to face malaria which is definitely useful for health policies in the twenty first century

Breaking the cycle: attacking the malaria parasite in the liver
Ute Frevert,Urszula Krzych, Thomas L. Richie,2016-01-06 Despite significant progress in the global fight against malaria this parasitic infection is still responsible for nearly 300 million clinical cases and more than half a million deaths each year predominantly in African children less than 5 years of age The infection starts when mosquitoes transmit small numbers of parasites into the skin From here the parasites travel with the bloodstream to the liver where they undergo an initial round of replication and maturation to the next developmental stage that infects red blood cells A vaccine capable of blocking the clinically silent liver phase of the *Plasmodium* life cycle would prevent the subsequent symptomatic phase of this tropical disease including its frequently fatal manifestations such as severe anemia acute lung injury and cerebral malaria Parasitologists immunologists and vaccinologists have come to appreciate the complexity of the adaptive immune response against the liver stages of this deadly parasite Lymphocytes play a central role in the elimination of *Plasmodium* infected hepatocytes both in humans and animal models but our understanding of the exact cellular interactions and molecular effector mechanisms that lead to parasite killing within the complex hepatic microenvironment of an immune host is still rudimentary Nevertheless recent collaborative efforts have led to promising vaccine approaches based on liver stages that have conferred sterile immunity in humans the University of Oxford s Ad prime MVA boost vaccine the Naval Medical Research Center s DNA prime Ad boost vaccine Sanaria Inc s radiation attenuated whole sporozoite vaccine and Radboud University Medical Centre s and Sanaria s derived chemoprophylaxis with sporozoites vaccines The aim of this Research Topic is to bring together researchers with expertise in malariology immunology hepatology antigen discovery and vaccine development to provide a better understanding of the basic biology of *Plasmodium* in the liver and the host s innate and adaptive immune responses Understanding the conditions required to generate complete protection in a vaccinated individual will bring us closer to our ultimate goal namely to develop a safe scalable and affordable malaria vaccine capable of inducing sustained high level protective immunity in the large proportion of the world s population constantly at risk of malaria

Malaria Targeting Toolkit: Host-Parasite Interaction Jing-wen Lin,Takeshi Annoura,Miguel Prudêncio,Deirdre A.

Cunningham,2022-01-10 **Parasite Infections: From Experimental Models to Natural Systems** Toni Aebischer,Kai Matuschewski,Susanne Hartmann,2018-07-06 Eukaryotic parasites including parasitic protozoans worms and arthropods are more complex and heterogeneous organisms than pathogenic bacteria and viruses This notion implies different evolutionary strategies of host exploitation Typically parasites establish long term infections and induce relatively little mortality as they often limit pathological changes by modulating host cells and downregulating adverse immune responses Their pattern of distribution tends to be endemic rather than epidemic Despite these seemingly benign traits parasites usually cause substantial chronic morbidity thus constituting an enormous socioeconomic burden in humans particularly in resource poor countries and in livestock worldwide Parasite induced fitness costs are an evolutionary force that can shape populations and contribute to species diversity Therefore a thorough understanding of parasites and parasitic diseases requires detailed knowledge of the respective biochemical molecular and immunological aspects as well as of population genetics epidemiology and ecology This Research Topic RT bridges disciplines to connect molecular immunological and wildlife aspects of parasitic infections The RT puts emphases on four groups of parasites Plasmodium Toxoplasma Giardia and intestinal helminths Co infections are also covered by the RT as they represent the most common form of parasite infections in wildlife and domestic animal populations Within the four types of parasites the following topics are addressed 1 Experimental models hypothesis testing translation and limits 2 Critical appraisal of experimental models 3 Natural systems Technological advances for investigations in natural parasite host systems and studies in natural systems 4 The urgent need for better models and methods in natural parasite systems Hence the RT covers and illustrate by the means of four main parasitic infections the parasite host system at the molecular cellular and organismic level **Advances in Malaria Research** Deepak Gaur,Chetan E. Chitnis,Virander S. Chauhan,2016-11-30 Thoroughly reviews our current understanding of malarial biology Explores the subject with insights from post genomic technologies Looks broadly at the disease vectors of infection and treatment and prevention strategies A timely publication with chapters written by global researchers leaders

Immunoparasitology: A Unique Interplay Between Host and Pathogen Xun Suo,Hyun Soon Lillehoj,Wenbin Tuo,Zhiguang Wu,2020-06-25 *Revisiting the Life Cycle of Parasitic Protozoa* Izabela Marques Dourado Bastos,Najma Rachidi,Claudia Masini d'Avila-Levy,2022-09-14 Epitope Discovery and Synthetic Vaccine Design Clarisa Beatriz Palatnik-de-Sousa,Irene da Silva Soares,Daniela Santoro Rosa,2018-07-12 Since variolation conventional approaches to vaccine development are based on live attenuated inactivated or purified pathogen derived components However effective vaccines against global health threats such as HIV parasite infections and tumors are difficult to achieve On the other hand synthetic vaccines based on immunogenic epitopes offer advantages over traditional vaccines since they are chemically defined antigens free from deleterious effects Additionally in contrast to live attenuated vaccines they do not revert to virulence in immunocompromised

subjects and different from genetic vaccines they do not involve ethical questions Traditional vaccines contain PAMPs and induce strong immune responses while recombinant vaccines are less potent In spite of the immunogenic weakness previously attributed to epitope based vaccines a synthetic vaccine containing a 17 amino acid epitope of the *Pseudomonas aeruginosa* Type IV pilus exceeded the protective potential of its cognate protein composed of 115 amino acids Therefore the efficacy yield of a synthetic vaccine can be potentiated by using the proper combination of target epitopes Recent advances in adjuvant development immunogen platforms for DNA vaccines and viral vectors also contributed to optimize immunogenicity Another constraint to the use of epitope vaccines was their restriction to some MHC or HLA phenotypes However epitopes containing 20 or less amino acids of *Plasmodium falciparum* and *Leishmania donovani* bind to multiple HLA DR and MHC receptors Thus synthetic epitope vaccines may better meet the requirements of the regulatory agencies since they have lower costs and are easier to produce The classical experimental approach for the development of an epitope based vaccine involves the use of recombinant domains or overlapping 15 mer peptides spanning the full length of the target antigen and the analysis of the induced antibody and or T cell immune responses in vitro or in vivo On the other hand in silico tools can select peptides that are more likely to contain epitopes reducing the number of sequence candidates T cell epitope prediction dates back to 1980s when the first algorithm was developed based on the identification of amphipathic helical regions on protein antigens Since then new methods based on MHC peptide binding motifs or MHC binding properties have been developed The recent reverse vaccinology concept uses high throughput genome sequencing and bioinformatics tools to identify potential targets of immune responses The feasibility of this approach was shown for the first time in the design of a vaccine against *Neisseria meningitidis* that is now in phase III clinical trials In addition different computational tools allow the determination of crucial genes through comparative analyses between different pathogenic strains Alternatively carbohydrates have been considered as key targets in developing safe and effective vaccines to combat cancer bacterial and viral infections Tumor associated carbohydrate antigens can be coupled covalently to protein carriers to target MHC receptors and improve immunogenicity and have reached already pre clinical and clinical studies In light of the recent availability of genomic tools we believe that in the near future an increasing number of vaccine candidates composed of defined epitopes will be available for synthetic vaccines showing improved protection

Human Challenge Studies in Endemic Settings Euzebiusz Jamrozik, Michael J. Selgelid, 2020-08-18 This open access book provides an extensive review of ethical and regulatory issues related to human infection challenge studies with a particular focus on the expansion of this type of research into endemic settings and or low and middle income countries LMICs Human challenge studies HCS involve the intentional infection of research participants and this type of research is rapidly increasing in frequency worldwide HCS are widely considered to be an especially promising approach to vaccine development including for pathogens endemic to LMICs However challenge studies are sometimes controversial and raise complex ethical issues some of which are especially

salient in endemic and or LMIC settings Informed by qualitative interviews with experts in infectious diseases and bioethics this book highlights areas of ethical consensus and controversy concerning this kind of research As the first volume to focus on ethical issues associated with human challenge studies it sets the agenda for further work in this important area of global health research contributes to current debates in research ethics and aims to inform regulatory policy and research practice Insofar as it focuses on HCS in endemic settings where diseases are present and or widespread much of the analysis provided here is directly relevant to HCS involving pandemic diseases including COVID19
