Abstract

The purpose of this study was to determine whether there were differences in the prevalence of risk factors for falls between nursing home residents who had fallen at least once during the previous year and those who had not. A cross-sectional survey of 106 nursing home residents was conducted. The results showed that the prevalence of risk factors for falls was significantly higher among residents who had fallen than among those who had not. The findings suggest that nursing home residents who have fallen are at a higher risk of falling again.
