The dynamics of finite-size settling particles Doychev, Todor,2015-01-27 This book contributes to the fundamental understanding of the physical mechanisms that take place in pseudo turbulent particulate flows In the present work we have considered the sedimentation of large numbers of spherical rigid particles in an initially quiescent flow field We have performed direct numerical simulations employing an immersed boundary method for the representation of the fluid solid interface The results evidence that depending on the particle settling regime i e Galileo number and particle to fluid density ratio the particles may exhibit strong inhomogeneous spatial distribution It is found that the particles are preferentially located in regions with downward fluid motion The particles inside clusters experience larger settling velocities than the average The flow in all flow cases is observed to exhibit characteristic features of pseudo turbulence The particle induced flow field is further found to be highly anisotropic with dominant vertical components The results indicate that in the present flow configurations the collective and mobility effects play significant role for the particle and fluid motion
