Membrane Structure and Mechanisms of Biological Energy Transduction

J. Avery, 2012-12-06 The problem of electron transfer phosphorylation was first formulated in 1939 by Belitser and Tsibakova I who introduced the P/O criterion and showed that this ratio is more than 1 The authors noted that such a high value of the phosphorylation coefficient suggests a fundamental difference in the mechanisms of ATP formation coupled with respiration and glycolysis since in the latter case the amount of the ATP synthesized is equal to that of the substrate utilized A lot of hypothetical schemes were put forward to explain the nature of coupling between electron transfer and phosphorylation but none of them solved the problem Only quite recently one hypothetical scheme of energy coupling viz Mitchell's chemiosmotic concept was supported by experimental data which allow us to prefer it to alternative possibilities In this paper I shall try to substantiate the statement that oxidation and phosphorylation can be coupled via a membrane potential as was postulated by Mitchell

Biological Membranes: Structure, Biogenesis and Dynamics Jos A.F. Op den Kamp, 2013-06-29 The Advanced Study Institute on Structure Biogenesis and Dynamics of Biological Membranes held in Cargèse from June 14-26 1993 has been dealing with four major topics in membrane biochemistry today lipid dynamics and lipid protein interactions protein translocation and insertion intracellular traffic and protein structure and folding The lecturers discussed these topics starting from several disciplines including biochemistry cell biology genetics and biophysics This way an interdisciplinary and very interesting view on biological membrane systems was obtained At first an extensive overview of mainly biophysical techniques which can be used to study dynamic processes in membranes was presented Sophisticated approaches such as ESR and NMR have been applied successfully to unravel details of specific lipid protein interactions x-ray analysis provides detailed structural information of several proteins and the possible implications for protein functions Information obtained this way is complemented by studies on mechanisms and kinetics of protein folding The latter information is indispensable when discussing protein translocation and insertion processes in which folding and unfolding play essential roles Extensive insight was offered in the complicated machinery of phospholipid biosynthesis In particular the application of sophisticated genetic techniques has allowed a better understanding of the mechanisms regulating the synthetic machinery and detailed studies on a variety of mutants lacking one or more of the essential enzymes have resulted in the beginning of a new biology of membranes
