

KEPLER'S LAWS OF PLANETARY MOTION

Guided Reading Comprehension

1. You are probably familiar with the fact that the planets orbit, or revolve around, the sun. However, have you ever thought about how long it takes for the planets to complete one orbit around the sun? Johannes Kepler, a revolutionary German astronomer and mathematician, was intrigued by the planet Mars, and studied how the planet revolved around the sun. Using the observations and work of past astronomers, Kepler devised three laws of planetary motion, and these laws still contribute to explain how planets orbit the sun.

Johannes Kepler
1571-1630

KEPLER'S 1ST LAW OF PLANETARY MOTION: THE ORBIT OF A PLANET IS AN ELLIPSE, WITH THE SUN AT ONE FOCUS

1. Kepler found that planets orbit around the sun in an **elliptical path**. This must be called an **ellipse**, or an elongated oval-shaped orbiting circle. An ellipse has two foci that determine the shape of the ellipse. Foci are plural for focus. The path of each planet around the sun is an ellipse with the sun at one focus. The other focus is represented by a point located on the opposite end of the ellipse. The further apart the foci, the more elongated an ellipse is.

2. An ellipse has a critical component known as **eccentricity**. Eccentricity is the measurement of how elongated a closed circle is, and is measured from the center of the ellipse. The eccentricity is the ratio of the distance between the foci to the length of the major axis (longer horizontal axis). A perfect circle has a length two and an eccentricity of zero, while the most elongated ellipses have an eccentricity of one. Basically, the greater the eccentricity, the more elongated an ellipse is.

3. The formula to find the eccentricity of an ellipse is $E = D \div L$. In words, the formula is that eccentricity is equal to the distance between the foci divided by the length or major (longer) axis of the ellipse.

To find the eccentricity of any ellipse, follow these steps:

1. Measure the distance between the foci in cm.
2. Measure the length of the long major axis in cm.
3. Divide the distance between the two foci by the length of the major axis (L).

$$E = D \div L$$

E = eccentricity
 D = distance between the 2 foci
 L = length of the major axis of the ellipse

4. Use a ruler to find the eccentricity of the ellipse below. Show your work.
