Human Anatomy

Read the definitions below, then label the digestive system anatomy diagram.

**anus** - the opening at the end of the digestive system from which feces exit the body.

**appendix** - a small sac located near the start of the large intestine.

**esophagus** - the long tube between the mouth and the stomach. It uses rhythmic muscle movements (called peristalsis) to force food from the throat into the stomach.

**gall bladder** - a small, sac-like organ located by the duodenum. It stores and releases bile (a digestive chemical which is produced in the liver) into the small intestine.

**large intestine** - the long, wide tube that food goes through after it goes through the small intestine.

**liver** - a large organ located above and in front of the stomach. It filters toxins from the blood, and makes bile (which breaks down fats) and some blood proteins.

**mouth** - the first part of the digestive system, where food enters the body. Chewing and salivary enzymes in the mouth are the beginning of the digestive process (breaking down the food).

**pancreas** - an enzyme-producing gland located below the stomach and above the intestines. Enzymes from the pancreas help in the digestion of carbohydrates, fats and proteins in the small intestine.

**rectum** - the lower part of the large intestine, where feces are stored before they are excreted from the body.

**small intestine** - the long, thin winding tube that food goes through after it leaves the stomach.

**stomach** - a sack-like, muscular organ that is attached to the esophagus. When food enters the stomach, it is churned in an acid bath.
