

Introduction to Similar Figures and Scale Factors

What are similar figures?

- Similar figures are the same shape, but can be different sizes. The sign \sim indicates that two shapes are similar. For example if $\triangle PQR \sim \triangle TUV$ is stating that triangle PQR is similar to triangle TUV .
- Similar figures have proportionate side lengths, which means that some scale factor is used to scale up or down all measurements of the figure.
- Similar figures have congruent angle measures. The scale factor changes the lengths of the sides, but not the measures of the angles.

Corresponding side lengths

Knowing which sides correspond to each other is very important when working with similar figures. Sometimes it's easy to tell which sides correspond, like in the figures below:

Side EC corresponds to side FG . Which side do you think corresponds to side ED ? _____. Which side do you think corresponds to side FE ? _____

However, sometimes it is a lot trickier to identify corresponding sides because the shape has been rotated or flipped around. You can find corresponding sides using the order of the letters in the name.

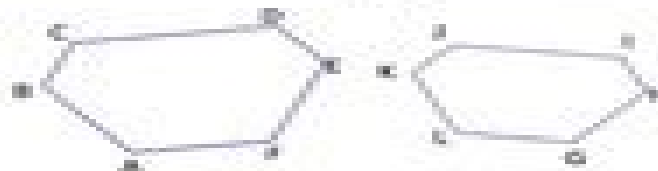

$\triangle ABC \sim \triangle DEF$

I know side AB corresponds to side DE because A and D are the first two letters in the names of the first triangle and E and F are the first two letters in the name of the second triangle.

Which side would correspond to side BC ? _____. Which side would correspond to side EF ? _____

Practice: Given that polygon $ABCODEF \sim GHVJEL$, state the corresponding side.

AB corresponds to _____. EF corresponds to _____
 BC corresponds to _____. DE corresponds to _____
 CD corresponds to _____. FE corresponds to _____

Being able to identify corresponding sides in similar shapes will be very important when you need to find missing measures in a set of similar figures. If sides AB and EF are corresponding it means that side AB became side EF when it was multiplied by the scale factor, or vice versa.
