Tribological Analysis and Design of a Modern Automobile Cam and Follower Guangrui

Zhu,Chris M Taylor,2001-08-22 An Engineering Research Series title This excellent and long awaited book is based upon

extensive research carried out by the Institute of Tribology at the University of Leeds in the UK and the Ford Motor Company Ltd It is concerned with both the theoretical and experimental study of the tribological performance of an automobile valve train having an offset taper cam and a domed follower incorporated with an hydraulic lash adjuster with particular reference to the ZETA engine valve train A sophisticated theoretical model has been developed that predicts the tribological

performance of the valve train and also provides a useful tool for the consideration of the tribological design of valve trains. Additionally, the model can estimate the instantaneous and average rotational frequency of the follower and the performance of the hydraulic lash adjuster. In order to validate the theoretical model, the experimental measurements have been correlated with the theoretical predictions that simulate the test conditions of the valve train. The agreement between the measurements and the predictions shows that the model is very reliable. This gives readers great confidence in using the model when dealing with novel and alternative designs of the valve train.
