Congress. House. Committee on Science and Astronautics, 1965 **Internal Combustion Engineering: Science & Technology** P.M. Weaving, 2012-12-06 Sir Diarmuid Downs CBE FEng FRS Engineering is about designing and making marketable artefacts The element of design is what principally distinguishes engineering from science The engineer is a creator He brings together knowledge and experience from a variety of sources to serve his ends producing goods of value to the individual and to the community An important source of information on which the engineer draws is the work of the scientist or the scientifically minded engineer The pure scientist is concerned with knowledge for its own sake and receives his greatest satisfaction if his experimental observations fit into an aesthetically satisfying theory The applied scientist or engineer is also concerned with theory but as a means to an end He tries to devise a theory which will encompass the known experimental facts both because an all embracing theory somehow serves as an extra validation of the facts and because the theory provides us with new leads to further fruitful experimental investigation I have laboured these perhaps rather obvious points because they are well exemplified in this present book The first internal combustion engines produced just over one hundred years ago were very simple the design being based on very limited experimental information The current engines are extremely complex and while the basic design of cylinder piston connecting rod and crankshaft has changed but little the overall performance in respect of specific power fuel economy pollution noise and cost has been absolutely transformed *Contemporary Research in Engineering Science* Romesh C. Batra, 2012-12-06 Fatigue failures occur in aerospace marine nuclear structures and automobile components from initiation and propagation of cracks from holes scratches or defects in the material To design against these failures crack propagation life and fracture strength need to be accurately predicted It is reported in the literature that these failures often initiate as surface cracks corner cracks and cracks emanating from fastener holes Such cracks are with elliptic or nearly elliptic in shapes The deviation from elliptic shape is due to varying constraint effect along the crack front Even in situations when the cracks are through the thickness of the material there would be thicknesswise variation of constraint effects leading to three dimensional nature of crack growth Accurate predictions of the crack growth in these cases by numerical methods can be made only by solving three dimensional boundary value problems Empirical relationships have been developed 1 based on Linear Elastic Fracture Mechanics over years describing fatigue crack growth response Some of these empirical relationships required modifications in the later stages to meet the design applications The Crack closure phenomenon discovered by Elber 2 3 during the crack

growth phase is mainly attributed to the local material yielding near the crack tip and the consequent residual plastic wake behind the crack tip It helped considerably in understanding several aspects of fatigue crack growth and rewrite these relations *Government and Science* United States.
