Explorations In Core Math Coordinate Algebra Workbook:

Explorations in Mathematical Physics Don Koks, 2006-11-30 Have you ever wondered why the language of modern physics centres on geometry Or how quantum operators and Dirac brackets work What a convolution really is What tensors are all about Or what field theory and lagrangians are and why gravity is described as curvature This book takes you on a tour of the main ideas forming the language of modern mathematical physics Here you will meet novel approaches to concepts such as determinants and geometry wave function evolution statistics signal processing and three dimensional rotations You ll see how the accelerated frames of special relativity tell us about gravity On the journey you ll discover how tensor notation relates to vector calculus how differential geometry is built on intuitive concepts and how variational calculus leads to field theory You will meet quantum measurement theory along with Green functions and the art of complex integration and finally general relativity and cosmology The book takes a fresh approach to tensor analysis built solely on the metric and vectors with no need for one forms This gives a much more geometrical and intuitive insight into vector and tensor calculus together with general relativity than do traditional more abstract methods Don Koks is a physicist at the Defence Science and Technology Organisation in Adelaide Australia His doctorate in quantum cosmology was obtained from the Department of Physics and Mathematical Physics at Adelaide University Prior work at the University of Auckland specialised in applied accelerator physics along with pure and applied mathematics

Dirk De Bock, 2023-03-08 The international New Math developments between about 1950 through 1980 are regarded by many mathematics educators and education historians as the most historically important development in curricula of the twentieth century It attracted the attention of local and international politicians of teachers and of parents and influenced the teaching and learning of mathematics at all levels kindergarten to college graduate in many nations After garnering much initial support it began to attract criticism But as Bill Jacob and the late Jerry Becker show in Chapter 17 some of the effects became entrenched This volume edited by Professor Dirk De Bock of Belgium provides an outstanding overview of the New Math modern mathematics movement Chapter authors provide exceptionally high quality analyses of the rise of the movement and of subsequent developments within a range of nations The first few chapters show how the initial leadership came from mathematicians in European nations and in the United States of America The background leaders in Europe were Caleb Gattegno and members of a mysterious group of mainly French pure mathematicians who since the 1930s had published under the name of a fictitious Nicolas Bourbaki In the United States there emerged during the 1950s various attempts to improve U S mathematics curricula and teaching especially in secondary schools and colleges This side of the story climaxed in 1957 when the Soviet Union succeeded in launching Sputnik the first satellite Undoubtedly this is a landmark publication in education The foreword was written by Professor Bob Moon one of a few other scholars to have written on the New Math from an international perspective The final epilogue chapter by Professor Geert Vanpaemel a historian draws together the overall thrust of the volume and makes links with the general history of curriculum development

especially in science education including recent globalization trends
