Review of Progress in Quantitative Nondestructive Evaluation Donald O. Thompson,Dale E. Chimenti,2012-12-06 The objective of this study was to increase the understanding of damage in composite materials with through the thickness reinforcements As a first step it was necessary to develop new ultrasonic imaging technology to better assess internal damage of the composite A useful ultrasonic imaging technique has been successfully developed to assess the internal damage of composite panels The ultrasonic technique accurately determines the size of the internal damage It was found that the ultrasonic imaging technique was better able to assess the damage in a composite panel with through the thickness reinforcements than by destructively sectioning the specimen and visual inspection under a microscope Microscopic determination of crack location

and lengths in a composite panel with through the thickness reinforcements was almost impossible Five composite compression after impact panels were tested The compression after impact strength of the panels with the through the thickness reinforcements was almost twice that of the comparable panel without through the thickness reinforcement
