Animal Sourced Foods for Developing Economies Muhammad Issa Khan, Aysha Sameen, 2018-12-21 Animal products are a good source of disposable income for many small farmers in developing countries. In fact, livestock are often the most important cash crop in many small holder mixed farming systems. Livestock ownership currently supports and sustains the livelihoods of rural poor who depend partially or fully on livestock for their income and/or subsistence. Human population growth, increasing urbanization and rising incomes are predicted to double the demand for and production of livestock products in the developing countries over the next twenty years. The future holds great opportunities for animal production in developing countries. *Animal Sourced Foods for Developing Economies* addresses five major issues: 1. Food safety and nutritional status in developing world; 2. the contribution of animal origin foods in human health; 3. Production processes of animal foods along with their preservation strategies; 4. functional outcomes of animal derived foods; and finally 5. strategies, issues and policies to promote animal origin food consumption. Animal sourced food contains high biological value protein and important micronutrients required for optimal body functioning but are regarded as sources of fat that contribute to the intake of total and saturated fatty acids in diet. The quality of protein source has a direct influence on protein digestibility as a greater proportion of higher quality proteins is absorbed and becomes available for bodily functions. Animal foods have high quantity and quality of protein that includes a full complement of the essential amino acids in the right proportion. Land availability limits the expansion of livestock numbers in extensive production systems in most regions and the bulk of the increase in livestock production will come from increased productivity through intensification and a wider adoption of existing and new production and marketing technologies. The significant changes in the global consumption and demand for animal source foods along with increasing pressures on resources are having some important implications for the principal production systems. In this book contributors critically analyze and describe different aspects of animal's origin foods. Each chapter is dedicated to a specific type of food from animal source, its nutritional significance, preservation techniques, processed products, safety and quality aspects on conceptual framework. Special attention is given to explain current food safety scenario in developing countries and contribution of animal derived food in their dietary intake. Existing challenges
