Haynes U of Montreal traces the history of musical pitch standards over the last four centuries linking frequency values to pitch names and telling where when and why various pitch levels have been used. With a focus on Italy France Germany the Netherlands and the Hapsburg lands he covers the pitches of about 1 400 historical instruments and how the design and function influenced and were influenced by changes in pitch. In addition he studies the effect of pitch differences on musical notation and choice of key. The author has also written a book on the oboe the instrument that plays the A to which a symphony orchestra tunes. Annotation copyrighted by Book News Inc Portland OR **no. 1. A-E** Oscar W. In the genomic era of 1990s 2000s pharmaceutical research moved to target based drug discovery which enabled development of a number of small molecule drugs against a wide range of diseases. In many cases however drugs that arose from genomics failed questioning the validity of the targets and the suitability of target based drug discovery as an optimal strategy for all disease states. For monogenic diseases target based approaches may be well suited to the identification of novel therapies. Most diseases however are caused by a combination of several genetic and environmental factors and are likely to require simultaneous modulation of multiple molecular targets pathways for successful treatment. For such diseases reductionist approaches focusing on individual targets rather than biological networks are unlikely to succeed and new drug development strategies are required. In search of more successful approaches the pharmaceutical industry is moving towards phenotypic screening beyond individual genes targets. However this requires rethinking of diseases and drug discovery approaches from a network and systems biology perspective. Since returning to the pre genomics era of screening drug candidates in laborious animal models is not a feasible solution the industry needs to evolve a new paradigm of phenotypic drug discovery within the context of systems biology. Such a paradigm must combine physiologically and disease relevant biological substrates with sufficient throughput operational simplicity and statistical vigour. Biomarker strategies for translational medicine as well as preclinical safety and selectivity assessments would also need to be revised to adapt to the target agnostic style. This focused issue aims to discuss strategies key concepts and technologies related to systems based approaches in drug development.

Design and implementation of innovative biological assays featuring multiple target strategies and rational drug design in the absence of target knowledge during the early drug discovery are illustrated with examples Specific topics include The need for systems based approaches in drug development Phenotypic screening strategies Compound libraries natural product inspired compound collections Target deconvolution and identification Target agnostic lead discovery and optimization Multi target approaches and decoding the phenotype understanding biological interactions and multiscale systems modelling Translational aspects Early evaluation of selectivity and safety in a target agnostic manner
