Multiple View Geometry in Computer Vision Richard Hartley, Andrew Zisserman, 2004-03-25 A basic problem in computer vision is to understand the structure of a real world scene given several images of it Techniques for solving this problem are taken from projective geometry and photogrammetry Here the authors cover the geometric principles and their algebraic representation in terms of camera projection matrices the fundamental matrix and the trifocal tensor The theory and methods of computation of these entities are discussed with real examples as is their use in the reconstruction of scenes from multiple images The new edition features an extended introduction covering the key ideas in the book which itself has been updated with additional examples and appendices and significant new results which have appeared since the first edition Comprehensive background material is provided so readers familiar with linear algebra and basic numerical methods can understand the projective geometry and estimation algorithms presented and implement the algorithms directly from the book

Euclid Vindicated from Every Blemish Gerolamo Saccheri, 2014-08-07 This first complete English language edition of Euclides vindicatus presents a corrected and revised edition of the classical English translation of Saccheri's text by G B Halsted It is complemented with a historical introduction on the geometrical environment of the time and a detailed commentary that helps to understand the aims and subtleties of the work Euclides vindicatus written by the Jesuit mathematician Gerolamo Saccheri was published in Milan in 1733 In it Saccheri attempted to reform elementary geometry in two important directions a demonstration of the famous Parallel Postulate and the theory of proportions Both topics were of pivotal importance in the mathematics of the time In particular the Parallel Postulate had escaped demonstration since the first attempts at it in the Classical Age and several books on the topic were published in the Early Modern Age At the same time the theory of proportion was the most important mathematical tool of the Galilean School in its pursuit of the mathematization of nature Saccheri's attempt to prove the Parallel Postulate is today considered the most important breakthrough in geometry in the 18th century as he was able to develop for hundreds of pages and dozens of theorems a system in geometry that denied the truth of the postulate in the attempt to find a contradiction This can be regarded as the first system of non Euclidean geometry Its later developments by Lambert Bolyai Lobachevsky and Gauss eventually opened the way to contemporary geometry Occupying a unique position in the literature of mathematical history
