Hydrogen and Fuel Cells Bent Sørensen, 2011-11-14 A hydrogen economy in which this one gas provides the source of all energy needs is often touted as the long term solution to the environmental and security problems associated with fossil fuels However before hydrogen can be used as fuel on a global scale we must establish cost effective means of producing storing and distributing the gas develop cost efficient technologies for converting hydrogen to electricity e g fuel cells and creating the infrastructure to support all this Sorensen is the only text available that provides up to date coverage of all these issues at a level appropriate for the technical reader The book not only describes the how and where aspects of hydrogen fuels cells usage but also the obstacles and benefits of its use as well as the social implications both economically and environmental Written by a world renowned researcher in energy systems this thoroughly illustrated and cross referenced book is an excellent reference for researchers professionals and students in the field of renewable energy Updated sections on PEM fuel cells Molten carbonate cells Solid Oxide cells and Biofuel cells Updated material to reflect the growing commercial acceptance of stationary and portable fuel cell systems while also recognizing the ongoing research in automotive fuel cell systems A new example of a regional system based on renewable energy sources reflects the growing international attention to uses of renewable energy as part of the energy grid Examples of life cycle analysis of environmental and social impacts

Life-cycle Analysis of Energy Systems Bent Sørensen, 2011 Life cycle assessment of new energy solutions plays an important role in discussions about global warming mitigation options and the evaluation of concrete energy production and conversion installations This book starts by describing the methodology of life cycle analysis and life cycle assessment of new

energy solutions It then goes on to cover in detail a range of applications to individual energy installations national supply systems and to the global energy system in a climate impact context Coverage is not limited to issues related to commercial uses by consultants according to ISO norms It also emphasizes life cycle studies as an open ended scientific discipline embracing economic issues of cost employment equity foreign trade balances ecological sustainability and a range of geo political and social issues A wealth of applications are described and a discussion on the results obtained in each study is included Example areas are fossil and nuclear power plants renewable energy systems and systems based on hydrogen or batteries as energy carriers The analysis is continued to the end users of energy where energy use in transportation industry and home are scrutinized for their life cycle impacts Biofuel production and the combustion of firewood in home fireplaces and stoves are amongst the issues discussed A central theme of the book is global warming The impacts of greenhouse gas emissions are meticulously mapped at a depth far beyond that of the IPCC reports A novel and surprising finding is that more lives will be saved than lost as a direct consequence of a warmer climate After a 2oC increase in temperature the reduction in death rates in areas with cold winters would outweigh the increase in the death rates in hot climates However this is only one of several impacts from greenhouse gases and the remaining ones are still overwhelmingly negative The fact that some population groups may benefit from higher temperatures notably the ones most responsible for greenhouse gas emissions whilst others who did not contribute much to the problem suffer is one of the main points of the book The book is suitable as a university textbook and as a reference source for engineers managers and public bodies responsible for planning and licensing
