Convex Integration Theory David Spring, 2010-12-02 1 Historical Remarks Convex Integration theory rst introduced by M Gromov 17 is one of three general methods in immersion theoretic topology for solving a broad range of problems in geometry and topology The other methods are i Removal of Singularities introduced by M Gromov and Y Eliashberg 8 ii the covering homotopy method which following M Gromov s thesis 16 is also referred to as the method of sheaves The covering homotopy method is due originally to S Smale 36 who proved a crucial covering homotopy result in order to solve the classification problem for immersions of spheres in Euclidean space These general methods are not linearly related in the sense that successive methods subsumed the previous methods Each method has its own distinct foundation based on an independent geometrical or analytical insight Consequently each method has a range of applications to problems in topology that are best suited to its particular insight For example a distinguishing feature of Convex Integration theory is that it applies to solve closed relations in jet spaces including certain general classes of underdetermined non linear systems of partial differential equations As a case of interest the Nash Kuiper C isometric immersion theorem can be reformulated and proved using Convex Integration theory of Gromov 18 No such results on closed relations in jet spaces can be proved by means of the other two methods On the other hand many classical results in immersion theoretic topology such as the classification of immersions are provable by all three methods
