
Program : 1**ALGORITHM : Binary Search**

Description : Search a key element with the starting address of data.

Step 1: Initialize the data segment with the starting address of array.

Step 2: Store lower index of array in bx, higher index of array in dx and key in cx.

Step 3: Compare the lower and higher indices, if its low > high then jump to label FAILURE else find the middle index=
(low index + high index)/2

Step 4: Compare the middle element with skkey. If skkey > = mid element jump to label BIGGER. Else get new higher index as (middle index-1) and continue the process from label AGAIN.

Step 5: If skkey =mid element goto label SUCCESS. Else find the new lower index as (index of mid element)+1 go to label AGAIN to repeat process.

Step 6: Store the result and display label appropriate message and terminate the program.

Multiple-chip Microcomputer Interfacing Peter Song, G. Jack Lipovski, 1988 **Introduction to Embedded Systems**

Manuel Jiménez, Rogelio Palomera, Isidoro Couvertier, 2013-09-11 This textbook serves as an introduction to the subject of embedded systems design using microcontrollers as core components. It develops concepts from the ground up covering the development of embedded systems technology, architectural and organizational aspects of controllers and systems processor models and peripheral devices. Since microprocessor based embedded systems tightly blend hardware and software components in a single application, the book also introduces the subjects of data representation formats, data operations and programming styles. The practical component of the book is tailored around the architecture of a widely used Texas Instruments microcontroller, the MSP430, and a companion web site offers for download an experimenter's kit and lab manual along with Powerpoint slides and solutions for instructors.

Getting Started with Tiva ARM Cortex M4 Microcontrollers Dhananjay V. Gadre, Sarthak Gupta, 2018-09-04 The book presents laboratory experiments concerning ARM microcontrollers and discusses the architecture of the Tiva Cortex M4 ARM microcontrollers from Texas Instruments, describing various ways of programming them. Given the meager peripherals and sensors available on the kit, the authors describe the design of Padma, a circuit board with a large set of peripherals and sensors that connects to the Tiva Launchpad and exploits the Tiva microcontroller family's on-chip features. ARM microcontrollers, which are classified as 32-bit devices, are currently the most popular of all microcontrollers. They cover a wide range of applications that extend from traditional 8-bit devices to 32-bit devices. Of the various ARM subfamilies, Cortex M4 is a middle-level microcontroller that lends itself well to data acquisition and control as well as digital signal manipulation applications. Given the prominence of ARM microcontrollers, it is important that they should be incorporated in academic curriculums. However, there is a lack of up-to-date teaching material, textbooks, and comprehensive laboratory manuals. In this book, each of the microcontroller's resources—digital input and output, timers and counters, serial communication channels, analog-to-digital conversion, interrupt structure, and power management features—are addressed in a set of more than 70 experiments to help teach a full semester course on these microcontrollers. Beyond these physical interfacing exercises, it describes an inexpensive BoB break-out board that allows students to learn how to design and build standalone projects as well as a number of illustrative projects.
