

DIFFERENCES

Size	Animal cells are usually smaller than plant cells. Animal cells range from 10 to 30 micrometers in length, while plant cells range from 10 to 100 micrometers in length.
Form	Animal cells come in different sizes and tend to be round or irregular in shape. Plant cells are more similar in size and are typically rectangular or cube shaped.
Energy storage	Animal cells store energy in the form of the complex carbohydrate glycogen. Plant cells store energy as starch.
Proteins	Of the 20 amino acids required to produce proteins, only 10 can be produced naturally in animal cells. The other so-called essential amino acids must be obtained through diet. Plants can synthesize all 20 amino acids.
Differential	In animal cells, only stem cells can transform into other cell types. Most plant cell types are capable of differentiation.
Growth	Animal cells increase in size by increasing in cell numbers. Plant cells primarily increase cell size by growing larger.
cell wall	Animal cells do not have a cell wall but have a cell membrane. Plant cells have a cell wall made up of cellulose as well as a cell membrane. Animal cells often have an irregular shape, while plant cells have a more regular, rigid shape. The cell wall is formed from a variety of compounds, of which cellulose is the most important. Cellulose helps to maintain the shape of the plant cell. This allows the plant to remain firm and upright, even if it grows very tall.
Centrioles	Animal cells contain these cylindrical structures that organize the assembly of microtubules during cell division. Plant cells do not typically contain centrioles.
Cilia	Cilia are found in animal cells, but not usually in plant cells. Zilions are microtubules that aid in cellular locomotion.
Cytokinesis	Cytokinesis, the division of the cytoplasm during cell division, occurs in animal cells when a cleavage furrow forms that pinches the cell membrane in half. In plant cell cytokinesis, a cell plate is set up that divides the cell.
