Names: Adrienne Mekelle B. Alcantara

Directions: In your groups of 2, complete the worksheet below. Each question should be answered by a different partner (i.e. you should not answer multiple questions in a row). Initial by the questions you complete.

1. A male and female bird have 4 unhatched eggs. The female is on the left heterozygous; the male on the right is homozygous recessive. Use B or b for your genotypes.

- a. Write the genotype of the female (left) below:

Answer: Bb

- b. Write the genotype of the male (right) below:

Answer: bb

- c. Which color is dominant, gray or black? How do you know?

Answer: It is gray, because the female's genotype has one dominant allele while the male has none.

- d. Write the phenotype of the female and the phenotype of the male below:

Answer: The female is gray and the male is black.

- e. Complete the Punnett Square below for this couple:

	b	b
B	Bb	Bb
b	bb	bb

- f. If they follow the Punnett Square ratios, what will the babies in the eggs look like when they hatch?

Answer: There are two grays

- g. Will all four offspring adhere exactly to the ratios predicted by the Punnett Square? Explain:

Answer: It is likely because the Punnett square only gave us a predicted probability.

Handbook of Statistical Genetics David J. Balding, Martin Bishop, Chris Cannings, 2008-06-10 The Handbook for Statistical Genetics is widely regarded as the reference work in the field. However, the field has developed considerably over the past three years. In particular, the modeling of genetic networks has advanced considerably via the evolution of microarray analysis. As a consequence, the 3rd edition of the handbook contains a much expanded section on Network Modeling including 5 new chapters covering metabolic networks, graphical modeling and inference, and simulation of pedigrees and genealogies. Other chapters new to the 3rd edition include Human Population Genetics, Genome wide Association Studies, Family based Association Studies, Pharmacogenetics, Epigenetics, Ethic and Insurance. As with the second Edition, the Handbook includes a glossary of terms, acronyms and abbreviations, and features extensive cross referencing between the chapters, tying the different areas together. With heavy use of up to date examples, real life case studies, and references to web based resources, this continues to be a must have reference in a vital area of research. Edited by the leading international authorities in the field: David Balding, Department of Epidemiology, Public Health, Imperial College; An advisor for our Probability Statistics series; Professor Balding is also a previous Wiley author having written *Weight of Evidence for Forensic DNA Profiles* as well as having edited the two previous editions of HSG. With over 20 years teaching experience, he has also had dozens of articles published in numerous international journals. Martin Bishop, Head of the Bioinformatics Division at the HGMP Resource Centre, as well as the first two editions of HSG. Dr Bishop has edited a number of introductory books on the application of informatics to molecular biology and genetics. He is the Associate Editor of the journal *Bioinformatics* and Managing Editor of *Briefings in Bioinformatics*. Chris Cannings, Division of Genomic Medicine, University of Sheffield. With over 40 years teaching in the area, Professor Cannings has published over 100 papers and is on the editorial board of many related journals. Co editor of the two previous editions of HSG, he also authored a book on this topic: [Omics and Systems Approaches to Study the Biology and Applications of Lactic Acid Bacteria](#). Konstantinos Papadimitriou, Jan Kok, Pierre Renault, Kimberly Kline, 2020-10-13 The economic importance of lactic acid bacteria (LAB) for the food industry and their implication in health and disease has rendered them attractive models for research in many laboratories around the world. Over the past three decades, molecular and genetic analysis of LAB species provided important insights into the biology and application of starter and probiotic LAB and in the virulence of LAB pathogens. The knowledge obtained prepared LAB researchers for the forthcoming opportunities provided by the advent of microbial genomics. Today, developments in next generation sequencing technologies have rocketed LAB genome research, and the sequences of several hundreds of strains are available. This flood of information has revolutionized our view of LAB. First of all, a detailed picture has emerged about the evolutionary mechanisms allowing LAB to inhabit the very diverse ecological niches in which they can be found. Adaptation of LAB to nutrient rich environments has led to degenerative evolution processes that resulted in shortening of chromosomes and simplified

metabolic potential Gene acquisition through horizontal transfer on the other hand is also important in shaping LAB gene pools Horizontally acquired genes have been shown to be essential in technological properties of starters and in probiosis or virulence of commensals Progress in bioinformatics tools has allowed rapid annotation of LAB genomes and the direct assignment of genetic traits among species strains through comparative genomics In this way the molecular basis of many important traits of LAB has been elucidated including aspects of sugar fermentation flavor and odor formation production of textural substances stress responses colonization of and survival in the host cell to cell interactions and pathogenicity Functional genomics and proteomics have been employed in a number of instances to support in silico predictions Given that the costs of advanced next generation methodologies like RNA seq are dropping fast bottlenecks in the in silico characterization of LAB genomes will be rapidly overcome Another crucial advancement in LAB research is the application of systems biology approaches by which the properties and interactions of components or parts of a biological system are investigated to accurately understand or predict LAB behavior Practically systems biology involves the mathematical modeling of complex biological systems that can be refined iteratively with wet lab experiments High throughput experimentation generating huge amounts of data on the properties and quantities of many components such as transcripts enzymes and metabolites has resulted in several systems models of LAB Novel techniques allow modelling of additional levels of complexity including the function of small RNAs structural features of RNA molecules and post translational modifications In addition researchers have started to apply systems approaches in the framework of LAB multispecies ecosystems in which each species or strain is considered as a part of the system Metatranscriptomics metaproteomics and metametabolomics offer the means to combine cellular behavior with population dynamics in microbial consortia
