Luck, Thérèse Zeegers-Huyskens, 1991 The study of intermolecular forces began over one hundred years ago in 1873 with the famous thesis of van der Waals In recent decades knowledge of this field has expanded due to intensive research into both its theoretical and the experimental aspects This is particularly true for the type of very strong cohesive force stressed in 1920 by Latimer and Rodebush the hydrogen bond a phenomenon already outlined in 1912 by Moore and Winemill Hydrogen bonds exert a profound influence on most of the physical and chemical properties of the materials in which they are formed Not only do they govern viscosity and electrical conductivity they also intervene in the chemical reaction path which determines the kinetics of chemical processes The properties of chemical substances depend to a large extent on intermolecular forces In spite of this fundamental fact too little attention is given to these properties both in research and in university teaching For instance in the field of pharmaceutical research about 13000 compounds need to be studied in order to find a single new product that can be successfully marketed The recognition of the need to optimize industrial research efficiency has led to a growing interest in promoting the study of inter molecular forces Rising salary costs in industry have encouraged an interest in theoretical ideas which will lead to tailor made materials

Intermolecular Interactions of Organic Compounds Alexei K. Baev, 2014-02-22 Prof Baev presents in his book the development of the thermodynamic theory of specific intermolecular interactions for a wide spectrum of organic compounds ethers ketones alcohols carboxylic acids and hydrocarbons The fundamentals of an unconventional approach to the theory of H bonding and specific interactions are formulated based on a concept of pentacoordinate carbon atoms New types of hydrogen bonds and specific interactions are substantiated and on the basis of the developed methodology their energies are determined The system of interconnected quantitative characteristics of the stability of specific intermolecular interactions is presented The laws of their transformations are discussed and summarized The new concept of the extra stabilizing effect of isomeric methyl groups on the structure and stability of organic molecules is introduced and the destabilization action on specific interactions is outlined
