

## Prove It task

A researcher is investigating the relationship between temperature and levels of the air pollutant nitrous oxide at a particular site. The researcher believes that there will be a positive correlation between the daily maximum temperature,  $x$ , and nitrous oxide level,  $y$ . Data are collected for 10 randomly selected days. The data, measured in suitable units, are given in the table and illustrated on the scatter diagram.

$x$	13.3	17.2	16.9	18.7	18.4	19.3	23.1	15.0	20.6	14.4
$y$	9	11	14	26	43	25	52	15	10	7

- Calculate the value of Spearman's rank correlation coefficient for these data. [5]
- Perform a hypothesis test at the 5% level to check the researcher's belief, stating your hypotheses clearly. [5]
- It is suggested that it would be preferable to carry out a test based on the product moment correlation coefficient. State the distributional assumption required for such a test to be valid. Explain how a scatter diagram can be used to check whether the distributional assumption is likely to be valid and comment on the validity in this case. [3]
- A statistician investigates data over a much longer period and finds that the assumptions for the use of the product moment correlation coefficient are in fact valid. Give the critical region for the test at the 1% level, based on a sample of 60 days. [2]
- In a different research project, into the correlation between daily temperature and ozone pollution levels, a positive correlation is found. It is argued that this shows that high temperatures cause increased ozone levels. Comment on this claim. [3]

**Handbook of Quantitative Criminology** Alex R. Piquero, David Weisburd, 2009-12-16 Quantitative criminology

has certainly come a long way since I was first introduced to a largely qualitative criminology some 40 years ago when I was recruited to lead a task force on science and technology for the President's Commission on Law Enforcement and Administration of Justice. At that time criminology was a very limited activity depending almost exclusively on the Uniform Crime Reports (UCR) initiated by the FBI in 1929 for measurement of crime based on victim reports to the police and on police arrests. A typical mode of analysis was simple bivariate correlation. Marvin Wolfgang and colleagues were making an important advance by tracking longitudinal data on arrests in Philadelphia, an innovation that was widely appreciated. And the field was very small. I remember attending my first meeting of the American Society of Criminology in about 1968 in an anteroom at New York University; there were about 25-30 people in attendance, mostly sociologists with a few lawyers thrown in. That Society today has over 3,000 members, mostly now drawn from criminology, which has established its own clear identity but augmented by a wide variety of disciplines that include statisticians, economists, demographers, and even a few engineers. This Handbook provides a remarkable testimony to the growth of that field. Following the maxim that if you can't measure it, you can't understand it, we have seen the early dissatisfaction with the UCR replaced by a wide variety of new approaches to measuring crime victimization and offending.

**Multi-omic Data Integration** Paolo Tieri, Christine Nardini, Jennifer Elizabeth Dent, 2015-09-17

Stable predictive biomarkers and interpretable disease signatures are seen as a significant step towards personalized medicine. In this perspective, integration of multi-omic data coming from genomics, transcriptomics, glycomics, proteomics, metabolomics is a powerful strategy to reconstruct and analyse complex, multi-dimensional interactions, enabling deeper mechanistic and medical insight. At the same time, there is a rising concern that much of such different omic data, although often publicly and freely available, lie in databases and repositories underutilised or not used at all. Issues coming from lack of standardisation and shared biological identities are also well known. From these considerations, a novel pressing request arises from the life sciences to design methodologies and approaches that allow for these data to be interpreted as a whole, i.e. as intertwined molecular signatures containing genes, proteins, mRNAs, and miRNAs, able to capture inter-layer connections and complexity. Papers discuss data integration approaches and methods of several types and extents, their application in understanding the pathogenesis of specific diseases or in identifying candidate biomarkers to exploit the full benefit of multi-omic datasets and their intrinsic information content. Topics of interest include, but are not limited to:

- Methods for the integration of layered data, including but not limited to genomics, transcriptomics, glycomics, proteomics, metabolomics.
- Application of multi-omic data integration approaches for diagnostic biomarker discovery in any field of the life sciences.
- Innovative approaches for the analysis and the visualization of multi-omic datasets.
- Methods and applications for systematic measurements from single, undivided samples comprising genomic, transcriptomic, proteomic, metabolomic measurements, among others.
- Multi-scale approaches for integrated dynamic modelling and simulation.
- Implementation of applications, computational resources, and repositories devoted to data integration, including but not limited to data

warehousing database federation semantic integration service oriented and or wiki integration Issues related to the definition and implementation of standards shared identities and semantics with particular focus on the integration problem Research papers reviews and short communications on all topics related to the above issues were welcomed
