Newsome, 1983 The unsteady compressible Reynolds averaged Navier Stokes equations were solved for the flow field about an external compression axi symmetric inlet with a length to diameter ratio $L/D = 15.88$ at Mach 2.0 and a Reynolds number based on diameter $Re_D = 2.36 \times 10^6$ operating in the near critical and subcritical flow regimes The near critical solution reached a stable steady state while the subcritical solutions attained an unstable bounded oscillatory state characterized by large amplitude pressure oscillations and traveling shock waves This phenomenon is a result of a shear layer instability combined with a closed loop feedback of reflected disturbances and the naturally occurring self sustained oscillations are commonly known as buzz Numerical results are given in terms of Mach contours velocity field plots pressure time traces at selected stations as well as mass flux and other mass averaged quantities along the duct length Comparison with experiment is also given Author **Previews of Heat and Mass Transfer** ,1991
