The Quintessential PIC®

Microcontroller Sid Katzen, 2013-03-09 Microprocessors and their microcontroller derivatives are a ubiquitous if rather invisible part of the infrastructure of our 21st century electronic and communications society. In 1998 it was reckoned that hidden in every home were about 100 microcontrollers and microprocessors in the sillig birthday card washing machine microwave oven television controller telephone personal computer and so on. About 20 more lurked in the average family car. For example monitoring in tire radio pressure sensors and displaying critical data through the car area network CAN. Around 4 billion such devices are sold each year to implement the intelligence of these smart electronic devices ranging from smart egg timers through aircraft management systems. The evolution of the microprocessor from the first Intel device introduced 30 years ago in 1971 has revolutionised the structure of society effectively creating the second smart industrial revolution coming to fruition at the beginning of the 21st century. Although the microprocessor is better known in its guise of powering the ubiquitous PC in which raw computing power is the goal, sales of such microprocessors as the Intel Pentium represent only around 2% of total volume. The vast majority of sales are of low cost microcontrollers embedded into a dedicated function digital electronic device such as the smart card. Here the emphasis is the integration of the core processor with memory and input/output resources in the one chip. This integrated computing system is known as a microcontroller.

The Essential PIC18® Microcontroller Sid Katzen, 2010-06-18 Microprocessors are the key component of the infrastructure of our 21st century electronic and digital information based society. More than four billion are sold each year for use in intelligent electronic devices ranging from smart egg timer through to aircraft management systems. Most of these processor devices appear in the form of highly integrated microcontrollers which comprise a core microprocessor together with memory and analog/digital peripheral ports. By using simple cores these single chip computers are the cost and size effective means of adding the brains to previous dumb widgets such as the credit card. Using the same winning format as the successful Springer guide *The Quintessential PIC Microcontroller* this down to earth new textbook guide has been completely rewritten based on the more powerful PIC18 enhanced range Microchip MCU family. Throughout the book commercial hardware and software products are used to illustrate the material as readers are provided real world in depth guidance on the design construction and programming of small embedded microcontroller based systems. Suitable for stand alone usage the text does not require a prerequisite deep understanding of digital systems. Topics and features uses an in depth bottom up approach to the topic of microcontroller design using the Microchip enhanced range PIC18 microcontroller family as the exemplar. Includes fully worked examples and self assessment questions with additional support material available on an associated website. Provides a standalone module on foundation topics in digital logic and computer architecture for microcontroller engineering. Discusses the hardware aspects of interfacing and interrupt handling with an emphasis on the integration of hardware and software. Covers parallel and serial input/output timing analog and EEPROM data handling.

techniques presents a practical build and program case study as well as illustrating simple testing strategies This useful text reference book will be of great value to industrial engineers hobbyists and people in academia Students of Electronic Engineering and Computer Science at both undergraduate and postgraduate level will also find this an ideal textbook with many helpful learning tools Dr Sid Katzen is Associate to the School of Engineering University of Ulster at Jordanstown Northern Ireland
