deep water drilling and production risers in the oil industry This work has other engineering applications including
simulation of flow past tubular heat exchangers or submarine towed sensor arrays and the flow about parachute ribbons In
the present work a vortex method is used for solving the unsteady flow field This method demonstrates inherent advantages
over more conventional grid based computational fluid dynamics The vortex method is non iterative does not require artificial
viscosity for stability displays minimal numerical diffusion can easily treat moving boundaries and allows a greatly reduced
computational domain since vorticity occupies only a small fraction of the fluid volume A gridless approach is used in the flow

sufficiently distant from surfaces A Lagrangian remap scheme is used near surfaces to calculate diffusion and convection of vorticity A fast multipole technique is utilized for efficient calculation of velocity from the vorticity field The ability of the method to correctly predict lift and drag forces on simple stationary geometries over a broad range of Reynolds numbers is presented
