fundamental information is imperative for promoting sustainable land use and mitigating the negative impacts of resource competition. In Yemen, land cover mapping is essential to support growing concerns about food and nutrition security, improving the resilience of livelihoods to threats and crises in the context of climate change. This atlas contains the land cover dataset for Yemen prepared as part of a portfolio of projects aimed at enhancing governance and preventing conflicts across the country. The ultimate goal is to reduce displacement and irregular migration by promoting household food security, nutrition, and income. Creating an accurate initial inventory of natural resources is critical for sustaining these achievements over time. The new land cover dataset allows for detailed mapping of natural resources, human settlements, and activities in Yemen. It represents an updated dataset developed for Yemen, integrating high-resolution multi-temporal imagery, machine learning algorithms, and the Land Cover Meta Language (LCML) to support the Natural Resource Management strategy, land use planning, and other innovative approaches.

Improve agriculture monitoring systems through satellite imagery for the Islamic Republic of Iran Food and Agriculture Organization of the United Nations, 2019-12-09. Due to more and more frequent extreme climate events (floods, drought, and frosts) and due to the changes in precipitation amounts, seasonality, intensity, and warming temperatures that are impacting rainfed agriculture and changing growing seasons, the Ministry of Jihad e Agriculture (MOJA) of the Islamic Republic of Iran asked the Food and Agriculture Organization of the United Nations (FAO) to provide assistance in setting up an improved agriculture monitoring system based on integral use of advanced geospatial technologies to support development of the techniques, policy, and investment conditions to achieve sustainable agricultural development under the current changing conditions of climate. The project has focused on the identification of state-of-the-art methods and strategy for acreage and yield estimation based on an assessment of the existing monitoring methodology, optimized through the use of remote sensing. In addition, the project benefitted from the availability of multi-temporal satellite images for testing and monitoring of a range of crops in 3 selected pilot areas: the provinces of Zanzan and Mazandaran and the region of the south of Kerman. The publication reports data collected, processes followed, and results obtained at this stage of the still not completely concluded study.

Imaging Floods and Glacier Geohazards with Remote Sensing Francesca Cigna, Hongjie Xie, Karem Chokmani, 2021-05-11. Remote sensing plays a pivotal role in understanding where and how floods and glacier geohazards occur, their severity, causes, and types, and the risk that they may pose to populations, activities, and properties. By providing a spectrum of imaging capabilities, resolutions, and temporal and spatial coverage, remote sensing data acquired from satellite, aerial, and ground-based platforms provide key geo-information to characterize and model these processes. This book includes research papers on novel technologies, e.g., sensors, platforms, data, e.g., multi-spectral, radar, laser scanning, GPS, gravity, and analysis methods, e.g., change detection, offset tracking, structure from motion, 3D modeling, radar interferometry, automated classification, machine learning, spectral indices, probabilistic approaches for flood and glacier imaging. Through target applications and case studies distributed globally, these articles contribute to the discussion on the

current potential and limitations of remote sensing in this specialist research field as well as the identification of trends and future perspectives
